Abstract

skills Human are most demanded and perishable resource in all sectors of life. There is a shortage of skills in comparison with demand of skills, where role of Commerce and Management Education is vital. NSDC has been stared PPP in India for upgrading skill of Indian workforce, with the target of skilling 500 million people by 2022. The researcher has interviewed 52 students sample respondents at Department of Commerce and Shivaji Management, Kolhapur. MS. University, India. Researcher has focused on Employability through skill building of the commerce and management students by way skill training. Researcher has referred the activities which have been conducted on and off the Shivaji University campus and made the suggestions like

outcome based practical teaching, self- learning, ICT based teaching, cara-van, employee bank, finishing school concept etc.

Key Words: Skill Mapping, NSDC, Cara-Van, Outcome, Employee Bank.

1. Introduction:

Human Resource Management and Development (HRM & D) activities include manpower planning, selection. recruitment, employee participation. compensation, performance appraisal. internal labour management and training. HRMD activities can influence the organization's performance by direct through improvement of means employee's skills and quality. India has one of the largest higher education systems in the world, with more than 36,700 Colleges, 825 Universities and Vocational Institutes. India is the third largest country in the world in students', after China and the United States, which is considered as a demographic dividend. National Skill Development Corporation (NSDC) is a first of its kind public private

ISBN : 978-81-947453-1-0

partnership (PPP) in India for upgrading skills of the growing Indian workforce through various programmes and VTP's. The objective of NSDC is to contribute about 30% to the overall target of skilling 500 million people inIndia by 2022. (Ref. Yojana, May 2012, Pp 25 - 26). Eleven sectors viz. 1.Automobile, 2.Electronics. 4.Construction. 3.Textile. 5.Food Processing. 6.IT. 7.Media and Entertainment, 8. Health Care, 9. Banking, Insurance and Finance, 10.Education and 11.Unorganized sectors have considered for skill development for employability enhancement. The researcher has interviewed 52 student respondents with 14 variables for data collection and interpretation.

2. Objectives:

- To study the required skills for employability.
- 2. To study the perception of the students.

3. Hypothesis:

"There is a skill gap between expectations from job seekers and job providers for the job in the Kolhapur district of Maharashtra state.

4. Research Methodology:

The researcher has collected data through questionnaire and discussion. To develop the solution for measurement of

employability index or skill development. the researcher has interviewed 52 PG students through structured questionnaire with 11 point scale and 14 basic variables like satisfaction of last educational qualification, interview attended, work place choice, job position, skills possessed, self- performance level, skills learned through earlier education, job getting possibility, real competitiveness, reason of joining further job, strength and opportunities, leadership and team building approach, decision making skills. conceptual knowledge, interpersonal relations, communication skill, initiative skill goal and target clarity, level of confidence etc.

- 5. Analysis and Interpretation of Data:
- A. Experiment of Employability Skill Enhancement:
- B.Skill Development Model suggestions for Employment Enhancement –
- a. Skill Development Training -Skill development training is required for effective performance and fulfilling the job requirements. Skill development facilities are required for effective training. The facilities includes sufficient infrastructure,

furniture chalkboard. chart and graphs, computer, LCD, smart board, audio system. DVD player, lighting control, effective arrangement of furniture, etc. Different sectors are having different preconditions, requirements, durations, size of the batch, different location, different understanding capacity etc, accordingly; skill should be imparted. In short, skill training is required for employability enhancement.

b. Advertisement and Publicity -The universities and colleges should do the advertisement and publicity for creating the awareness about skills development for employability enhancement. One can think to develop "Skill Building Brand Ambassador". Researcher has suggested that to nominate as a "Skill Brand Building Ambassador" from the same district who is a role model for "Brand others. The Ambassador" can be nominated in each and every distinct on the and basis of characteristics

location of the district. It is also suggested that one "Brand Ambassador" can be nominated for whole Maharashtra state. In today's competitive and glamorous world, Brand Ambassador is essential. It is specially suggested that the Brand Ambassador should be district wise who is known to others. For marketing of various skills; posters, banners, meetings and programmes should be arranged. Radio and television advertisement may be started for skill development.

c. Resource Persons / Trainers -The trainer should be a knowledgeable and practicable person for imparting the skills. "Only practical" things should be taught for employability enhancement. Applications can be collected from collected and selection should be made on the basis of qualification, experience, specialization etc. The core committee should control and superior the selection and job performance of the candidate. Role of the trainer in skill building programme is very important, so, proper selection method for trainer should be adopted. Honorarium of the skill trainer should be linked with employability of theparticipants.

- d. Syllabus The researcher has suggested that the syllabus for employability enhancement should be flexible. The syllabus should be changes from time-totime by eminent and experienced personalities with only practical approach. The need based syllabus should be prepared. Job Provides' views should be incorporated in the syllabus. The syllabus should cover all aspect of the concern skill building topic and latest concepts. Prepared syllabus should get approved from the expert committee.
- e. Skill Mapping It is suggested that at the end of every employment enhancement programme, skill mapping should be conducted. The evaluation should be conducted through third party. It is merely skill building programme where

practical and employability enhancement activities should be conducted. 100% attendance (Except Exceptions) and more than 75% marks / score or grade A or B should be secured then only certificate will be issued. The employment ability test paper can be designed time to time and as per the need. The test can be designed online for a few skills building programme where it is possible. The evaluation should be conducted through third party.

Employability

Enhancement Methods -

The researcher has suggested to participative conduct lecture method, GD, role playing, case study, brainstorming, T-group training, buzz group method direct involvement of every member of large group in discussion process, management games, syndicate method - big group divided to in cluster/syndicate and group conducted discussion among syndicates/clusters, conference. project, workshop, forum method

ISBN : 978-81-947453-1-0

elC.

Conclusion

According to Skill Mapping survey, before and after, average 116% growth has found with 14 variables and 11 point scale. It is an experimental research which has proved the set hypothesis. According to Radstuds Survey (Ref. Daily Lokmat dated 28.4.2012, P. 5), a company is doing research in H. R. sector in worldwide, who contributed their survey report regarding India that the Indian job seekers are not interested about heavy salary, heavy incentives and other monetary benefits but they are more interested about. "guarantee of job and job security" in existing job. "job security is more preferable than fat salary". It can be correlated with skill gap study of the Kolhapur district, that the job seekers and existing employees will be more comfortable due to 'job security' and not heavy / bulky / fat salary or wages. It means that "skills" are very much essential for job security and fat salary or wages. If candidate or employee is not having sufficient skills then he may come in trouble for getting the job as well as in service tenure. Required skills for employability enhancement and the perception of various stakeholders are very significant. **References**

A Study on the Current Trend of Agricultural Productivity in India and itsFuture Prospects CH. KONDALA RAO, M.Com, Bed, (Ph. D), VSR Government Degree & PG College, Movva Contact No.:9912131612 Email Id: kry.anu@gmail.com

Abstract

The present research paper tries to establish a linkage between the structural, technological and institutional policy reforms, which are responsible for the success of sustainable agriculture development. Although India has achieved a significant growth rate recently, it still suffers from agricultural distress. Hence this paper tries to reveal the present trend of agriculture productivity and its future prospects. Some secondary data have been collected to explore upon the realistic scene of agriculture and various policy initiatives made by the government. With the analysis of secondary data and extensive literature review, I have given some of the suggestive ideas for the growth and productivity of this sector.

Key Words: Agriculture, Growth, Productivity, Farm, Reforms.

INTRODUCTION

The agriculture sector of India is passing through had dynamic phase in there center of development. It provides 65% of employment opportunities for the working population of India. Since post-independence period, the Government of India has been initiating its policy framework for the structural, technological and institutional changes for agriculture. During 1st five year plan (1951-56), the special address was for the agriculture sector to deal with the food crisis. Since then there is found continuous decline in the composition of GDP from the agriculture and allied activities. With the concern of agricultural crisis and lower productivity, the 11th fiveyear plan (2007-08 to 2011-12) made a target to reverse the deceleration in agriculture growth and productivity. On 12th five year plan the main focus is for the rapid and inclusive growth of the agriculture. These include, technological advancement, adoption of (High yielding Varieties) HYVs of seeds, usage of improved quality of fertilizers, insecticides, pesticides, new cropping pattern, new irrigation facilities, farm research and management practices.

	Year	Agriculture		Indus	Servi
	&	Allied	try	ces	
		secto	rs		
	1950-51	53.1		16.6	30.3
	1960-61	48.7		20.5	30.8
	1970-71	42.3		24.0	33.8
	1980-81	36.1		25.9	38.0
	1990-91	29.6		27.7	42.7
	2000-01	22.3		27.3	50.4
	2012-13	13.9		27.3	58.8
	2020-21	13.9		26.1	59.9

LITERATURE REVIEW

Indian farm sector is highly recognized for its diversified trend of climate, cultivation pattern and numerous policy recommendations. It cannot be said confidently that we have

achieved an absolute self-sufficiency in terms of food grain production due to the existence of poverty, malnutrition and hunger. The policy reform alone is not enough to raise agricultural growth. The policy reforms must be accompanied by appropriate and efficient investments in public goods such as rural infrastructure, irrigation, agricultural research and extension of education and health of rural people. However our future of farm sector depends on the budgetary policyframework of the government and right kind of public investments, Robert E. Evenson et al. (1999). Today India agriculture research is considered as one of the largest research works in the world. It has now achieved the progressive scale of agricultural growth due to adoption of modern technology and innovation. In many developed countries there is found declining trend of R & D for which there is found substantial down fall of overall productivity. The restoration of the growth in spending on agricultural R&D may be necessary to prevent a longer-term foodprice crisis, Julian M. Alston et al (2009). In developed countries, there have been a wide range oftechnological advances for agriculture, genetic improvement, usage of chemical fertilizers and pesticides, adoption of farm equipment and machinery, cultural and management practices. Research in both public and private sectors has been the principal source for new technologies and management. In fact Private sector agricultural R&D expenditures have been growing much faster than public agricultural research expenditures, Wallace E. Huffman (2010). Recently, attempts have been made to combine both eco

innovation and pro-environmental activities for the effective outcome of product, process and practice in the farm sector. With the adoption of Eco- innovation approach, we can have lower consumption of natural resources, lower volume of carbon emission and high encouragement for eco-friendly business practices. Some innovative agricultural core business can actually raise the farm productivity . and its contribution towards GDP. The impact of environment and climatic change could be observed thoroughly which plays the most important role for production and any other economic activity. Along with the objectives of storage, marketing facilities, recycling process, employment facilities, and customers based strategy on the entire idea of go green seems to be positive in the farm and rural environment Lynn Martin et al (2013). The economic survey report has mentioned following drawbacks of the Indian agriculture sector.

MAJOR DRAWBACKS OF FARM SECTOR IN INDIA

- I- The growth rates of productivity in agriculture sector are far below than the global standards.
- II- The productivity levels of rice and wheat have declined after the green revolution of the 1980s.
- III- Due to declining fertilizer-use efficiency there is found gradual decline in the soil fertility. Also, the food subsidy has increased substantially in the past few years.
- IV- According to the survey, GDP declined to 15.2% during the Eleventh Plan and then furtherdecreased to 13.9% in 2013-14.
 - V-There also has been decrease in the number

of cultivators from 127.3 million (Census 2001)to 118.7 million (Census 2011).

- VI- Indian agriculture is still dependent on rainfall. About 60 per cent of the total food grains and oilseeds produced being grown in the kharif season, and with just about 35 per cent of the total area being irrigated.
- VII- Currently, India is in an anomalous situation of being essentially selfsufficient with largestocks of food grains on the one hand and recording high food inflation. Artificial scarcity has become the major cause for the high inflation rate.

Technological Reforms

Although India is considered as the labour surplus economy, the farmers of different parts of the country are bound to adopt technology to boost farm productivity. The technological reform in the agriculture was introduced in the year 1960s. It introduced High yielding verities (HYV) of seeds to improve overall production. This also introduced chemical fertilizers, pesticides and technological advancement for the productivity and growth of farm sector. The same category of revolution was felt.During eleventh five year plan 11th five year plan, to keep pace with improved production .The new machines have been developed for the effective cultivation, farm operation, harvesting, grading, packaging and value addition. In the same way we can quote some of the targets set by our Prime Minister Mr Narendra Modi, who has addressed to the nation for raising farms productivity and for adoptingagricultural technologyrecently. He has given priority for the

adoptionofnewtechnologywhichwouldreachatf armerstocateroverallagriculturaldevelopment. He has also recommended "Lab to land "which is the biggest challenge for the country like India. He addressed that the progressive farmers are our real talent. The main task of various research and agricultural institutes, is to train farmers through radio and other electronic multi media for the knowledge and actual benefits. It is essential on the part of both government and private sector to bring accelerated growth in the farm sector with expenditure, equipment and efficiency.

Institutional Reforms

In the post-independence period, the agriculture reform was introduced for the abolition of zamindari system, consolidation of land holding, crop insurance schemes etc.

However there is found dynamic changes in the institutional reforms of agriculture in a recent era of development. The land development programme was for the first time introduced in theyear 1980s. It introduced crop insurance against drought, flood and crop disease. Gramin banks and other cooperative societies were formed to give financial assistance in the form of loans. The main objective was to give agricultural loans at a cheaper rate of interest. Kishan credit card was developed with the combined effort of NABARD and RBI with the availing credit of Rs. 50, 000/-Similarly after that the PDS, FCI, MSP schemes and programmes were introduced to give financial assistance and food grains to poor and land less farmers at a subsidised rate. In case of fertilization, biotechnology products bio-fertilizer and bio-pesticide are like

produced from renewable energy sources in a cheaper and environment friendly way.Biofertilizers are very important source for enhancing the nutrient supplies for plants by virtue of fixing atmospheric nitrogen and maintaining soil nutrients. Those initiatives have been takenas the key component of the Integrated Plant Nutrient System (IPNS), (Lab to land project, NorthMaharashtra University). In the recent budgetary announcement priority given for the agricultural upliftment. The allocation of Rs5, 300 crore was made to watershed support micro-irrigation, development and the Pradhan Mantri Krishi Sinchai Yojana.In order to support the agriculture sector with the help of effective agriculture credit, the focus has been given on small and marginal farmers. The special target has been made by the Government has been set up for Rs8.5 lakh crore of agricultural credit. The proposal has been made for an allocation of Rs34,699 crore for the success of schemes like MNREGA.

POLICY RECOMMENDATIONS FOR AGRICULTURE DEVELOPMENT AND ITS FUTURE PROSPECTS

India is traditionally known as the agrarian country as more than 60% people depend on the agriculture both directly and indirectly for their livelihood. So far the key challenges and priorities are concerned; Indian Agriculture can attain the global standard if we can have propercoordination between policy frame work and its implementation. We can have following policy recommendation; those can go a long way for catering accelerated agricultural growth.

Innovative and Sustainable Farming

Various innovative farming has been set up to meet the challenges of food shortage, natural hazards and poverty in India. The organic farming has grown almost 29 fold during the last five years and has successfully met the challenges. It has created the options for debt free, quality based profitable livelihood. With the theme of consumer-centric and new market controlled agricultural system, it has grown 25. 30% every year. Similarly greenhouse technology of farming has enhanced farm productivity by 3-4 times ahead of normal farming pattern. In the same way poly house farming has raised the agriculture output at about 10 times higher than the previous time due to cost efficiency. absence of insecticides and pesticides and with temperature controlled atmosphere. These success stories of different innovative farming pattern can enhance agriculture productivity with the government and various institutional support. In order to face the climatic challenges, India has organized a document namely the National Action Plan (NAP) on Climate Change. It provides a direction for changes at the national level in policy. planning and public-private partnerships. It has open up the global vision for modifying longer time trends for sustainable development.

Infrastructure Development

MNREGA, RGGVY, REDB, IAY, DRDAs are some of the government based initiatives to bring infrastructural development in the villages of India. It is essential on the part of the government to consolidate various schemes as per the requirements for which there will be ideal utilization of fund and control of corrupt practices in various layers. The impact of rural infrastructure has greater role to play for the eradication of poverty as per the millennium development goals (1990- 2015). The rural infrastructure development fund (RIDFs) has provided the implementation support by NABARD up to the extent of 90% of total support and budgetary support by the remaining portion of the cost.

Technological Advancements

As per the department of Science and technology, government of India, grant is given to twenty one science based voluntary groups working at the village level. This will encourage research and development activities in areas of technology generation and transfer for sustainable livelihoods in rural areas. It has also encouraged thematic networking and coordination amongst various science and technology based field groups. National Food Security Mission (NFSM) has been launched in 2007 to increase 20 million tonnes of foodgrains (10 m.t. for rice, 8 m.t. for wheat and 2 m.t. for pulses) during the 11th plan period. It has already shown some results by increasing yields in different regions. The ATMA (Agricultural Technology Management Agency) scheme was launched in 2005 to support state governments' efforts to revitalize the extension. This scheme gives an opportunity to improve extension system. The returns to investment on research and extension will be much higher on agricultural growth as compared to other investments.

Private Sector Interference

In recent years the priority has been given for public private partnership (PPP) for the infrastructure development and other growth related services. About I lakh common services centres have been established with the sustainable, commercial and socio-economic goals to cater IT based and non-IT based services for about 600,000 villages. Different SHGs, Community based organisations, Private micro finance institutions like SKS, have been formed to give financial assistance to rural community for developmental projects. With the Provision of urban amenities in rural areas (PURA), there is found the opportunities of rural livelihood, infrastructure projects with the private sector interference. It in turn has given sufficient scopefor sectoral disparities.

Effective Price Mechanism and Financial Support

As per Dr M.S. Swami Nathan, the distinguished agricultural economist, said, "The agrarian crisis has its roots in the collapse of the rural economy ... Unemployment leading to out-migration of the asset-less is growing. The minimum support price mechanism is not operating for most commodities. At every level of the livelihood security system, there is a tendency to make profit out of poverty. Something is terribly wrong in the countryside." Although there have been some improvements in flow of farm credit in recent years. For this the government has to take care of share for the small and marginal farmers by providing Minimum support Price (MSP), easy credit accessibility, investment on cold storage, and support for raising Hi- value products likemilk, meat, Vegetables and fruits. Similarly all the credit and loan provision has to be made for the growth of allied activities like animal

husbandry, fishery, horticulture, herbal cultivation.

Improved Trade Policy

India is considered as the second largest food producer in the world. Although, it has got all the potentials in the agriculture productivity but its export is just 0-9% of the world food trade. However with the prime minister's council on trade and industry report, following action plans have been suggested for enhancing trade, and supply of agricultural goods.

- Undiluted focus on growing areas for exports like tea, spices, rice, mangoes, grapes,floriculture etc.
- Allow regulated exports of specific surplus commodities on annual basis and honour international contractual terms.
- Cold storage facilities should be enhanced and be made available at all ports and airports
- Increase in freight subsidy
- One central agency: Agro and Food Development and Export Promotion Council to be setup.
- Announce specific package for horticulture and floriculture units.
- Provide term loans for Grading, Packing and Cold chain units as well as processing units at the rate of 9% per annum.
- 3 year moratorium on repayment of term loan and interest
- NABARD to provide 100% refinance to banks and financial institutions for fundingexports of horticulture products.

CONCLUSION

We have gone through the current structural, institutional and technological reforms for the overall growth of the economy. It is necessary on the part of the government to give due priorities to key segments like marketing, price mechanism, technology, R &D and trade, Similarly it has been observed with the support of the government and private interference the goal of sustainable agricultural growth can be attained. At the same time priorities must be given to enhance the overall standard of living of the rural poor so that it would go a long way for eliminating socio-economic constraints like poverty, hunger and malnutrition. This would be an appropriate way for giving the true justice to our father of nation, Mr M K Gandhi's intent for the villages, "the true India is not to be found in its few cities but in its seven hundred thousand villages, if the villages perish, India will perish too".

Social Entrepreneurship Research: Intellectual Structures and Future Perspectives

Dr. Venkateswarlu, M.Com, MBA, Ph.D Lecturer in Commerce VSR Government Degree & PG College, Movva Contact No.:9848341412; 9182387970 Email Id: kvragsgs@gmail.com

Abstract: Social entrepreneurship (SE) is an emerging research field that has received much scholarly attention in recent years. Given the global scope of this attention. this review explores the existing scientific literature on social entrepreneurship to contribute to a systematization of the research field. Based on the publications in Web of Science and Scopus, a total of 1425 scientific articles were analyzed. We used the bibliometric method to describe the evolution of social entrepreneurship research (e.g., evaluation by years, authors, scientific journal articles, and countries in the SE literature that have had the greatest impact in terms of production). In addition, we used the mapping of knowledge networks through the citations and co-citations analysis to identify schools of thought. A keyword cooccurrence analysis was performed to detect key research topics over the years. The results show that, although the research is still in a nascent phase, it has a multidisciplinary character. Furthermore, social entrepreneurship appears to be a concept closely linked to three schools of thought: commercial entrepreneurship, sustainable entrepreneurship, and social innovation. The keywords analysis allowed us to isolate the constructs that the literature has considered antecedents (e.g., sociopsychological factors) and accelerators

(e.g., education, network, culture, and gender) to the development of social entrepreneurial intention. We will further discuss the ways researchers can explore this research field and contribute to the global literature.

Keywords: social entrepreneurship; scientific mapping review; social innovation; social entrepreneur- ship education; sustainable entrepreneurship; commercial entrepreneurship.

Introduction

This article deals with the issue of social entrepreneurship (SE), the study of entrepreneurial initiatives aimed at exploiting opportunities to generate social value [1-3]. In the practice, there is a growing diffusion of forms of social entrepreneurship, both in the non-profit sector, in which innovative approaches tend to spread that allow the generation of revenues, allowing the sustainability and development of individual initiatives, and in for-profit organizations that identify and pursue business opportunities aimed at jointly generating economic value for shareholders and social value. This has aroused the interest of scholars from various disciplines, who have tried to define the boundaries and distinc- tive characteristics of social entrepreneurship and to understand its determinants, success factors, and criticalities.

Social entrepreneurship is an emerging but rapidly growing field [4.5] involving diverse sectors such as innovation, technology, public policy, community development, non-profit and social movements, organizations [6]. The main objectives of social entrepreneur- ship are the reduction of poverty and illiteracy, the improvement of collective well-being and the quality of life of the community, the overcoming of social injustice, the conservation of the environment for future generations [7-10]. Several authors agree that the SE literature is still in an early stage of development [2]. This is evidenced by the fact that a universal definition has not yet been reached, partly as a consequence of the definition difficulties that characterize the more general field of entrepreneurship studies, and in part for the heterogeneity of the contributions that have addressed the issue from different points of view, often focusing on single specific areas. In general, social entrepreneurship can be considered as a form of social change by means of innovative ideas or actions to achieve

social objectives and create new value through an organization that is financially independent and self-sufficient.

Literature Review

Social entrepreneurship scholars have adopted different approaches to define the construct. However, a common element to many of the definitions in the literature is the creation of social value [1,2] or social wealth [3]. More generally, it can be said that in all the definitions analyzed, there is an explicit reference to the social dimension expressed through the creation of social value or to the pursuit of a social objective or mission or the impact of social entrepreneurship in terms of social benefits, mitigation or solution of social problems, satisfaction of social needs, social justice [11] or social change.

For example, Dees [1], considers the social entrepreneur as a change agent who works through a mission to create social value and the search for new opportunities to achieve that mission. Where others see problems, social entrepreneurs see opportunities. The will to innovate is part of the entrepreneurs' modus operandi, and it should not be understood as a sudden explosion of creativity, but as a continuous process of exploration and learning. Furthermore, entrepreneurs tend to have a high tolerance for ambiguity and learn to manage the risks associated with it. They see failure as a learning opportunity and act responsibly, using scarce resources efficiently, calculating risks so as to reduce the harmthat will result from failure.

This is an idealized definition, generally, the more an individual meets these requirements, the more he or she will be considered a social entrepreneur. As Dess [1] argues, in reality, many social entrepreneurs present these characteristics in different ways and to different degrees, and very few fit exactly this definition of social entrepreneur.

When systematizing the numerous contributions that characterize social entrepreneur- ship, in general, two lines of research distinguish the field in the literature. Indeed, many authors have limited the scope of social entrepreneurship to the non-profit sector, a sector on which the studies had initially focused, through the analysis of the differences between social enterprises and commercial enterprises. Other authors, especially recently, have extended the scope of social entrepreneurship to include hybrid organizations that combine economic and social goals.

According to Christopoulos and Vogl, while commercial entrepreneurs approach the problem from a purely economic point of view, social entrepreneurs are motivated by social needs. Of the same opinion is Olsen , according to whom the social entrepreneur uses the same tools that are usually used in the traditional sector, but applies them to solve social problems.

Austin et al. [8] used four variables to compare social and commercial entrepreneur- ship, trying to establish differences. The first variable used is market failure, which is a situation that describes an inefficient distribution of goods and services in the free market. In this sense, a problem for the commercial entrepreneur becomes an opportunity for the social entrepreneur. The second variable is the mission defined as the guide the values and visions that entrepreneur. In principle, the basic purpose of social entrepreneurship is the creation of social value for public welfare, while the entrepreneur seeks the cre- ation of profitable operations that result, in the first instance, in private profitability for the shareholders.

A third variable is resource mobilization, which refers to the set of activities put in place to ensure new and additional resources for the organization. On the one hand, "the nondistributive restriction on surpluses generated by nonprofit organizations and the embedded social purpose of for-profit or hybrid forms of social enterprise limits social entrepreneurs from tapping into the same capital markets as commercial entrepreneurs" [8] (p. 371). Finally, the fourth variable is defined as performance measurement, a process by which an organization monitors important aspects of its systems. Data are collected to reflect how its processes work, and this information is used to guide the organization's decisions over time. This represents a limitation for social enterprises, which, unlike commercial enterprises, encounter great difficulties in evaluating performance due to the impossibility of measuring the social impact.

Weerawardena and Sullivan Mort described opportunity identification as a separate activity in which social entrepreneurs actively seek opportunities to create social value. According to their study, the process of identification of opportunities and evaluation is simultaneously influenced by the social mission and by organizational and environmental sustainability. Regarding the sources of identification of opportunities, Thompson et al.found that opportunities could arise from an individual's vision or necessity. Grayson and Hodges, coined the term

"corporate social opportunity" to designate

ISBN: 978-81-947453-1-0

these opportunities, which correspond to the possibility of combining the creation of economic value for the company with a benefit for society. The authors defined these opportunities as "commercially viable activities which also advance environmental and social sustainability". These activities with economic and socio-environmental significance typically involve some form of innovation.

From this perspective, the social component of entrepreneurship consists of the ability to identify innovative solutions for problems. Therefore, specific social innovation is another key element of social entrepreneurs because it involves novelty for a relevant company in society [42], and it is what has distinguished social entrepreneurship from other forms of entrepreneurship, especially in recent years. Bloom and Chatterji, for example, explicitly identified social entrepreneurs as individuals who seek to solve or mitigate a social problem by developing change strategies that differ from those that have been used to address the problem in the past. The distinction with respect to other initiatives with social purposes lies in the innovativeness of the solutions adopted, which-by definition-can correspond to very different organizational forms, corporate forms, management practices, and business models: hence the consider- able heterogeneity of social entrepreneurship initiatives and the difficulty of describing its boundaries.

This approach reflects that of several works on entrepreneurship that attributes a central role to innovation and interprets entrepreneurship as the ability to recombine resources in an innovative way. Furthermore, similar to what has been found with regard to entrepreneurship in general, the definition of social entrepreneurship often emphasizes the change generated by the innovative action of the entrepreneur.

The Organization for Economic Cooperation and Development (OECD) defined entrepreneurs as agents of change in growth in a market economy; similarly, some authors have identified social entrepreneurs as agents of change in the social sector [1].

Social entrepreneurship is explicitly indicated in several contributions as a harbinger of social transformations. In this regard, Martin and Osberg underlined the ability of social entrepreneurs to identify stable equilibrium situations characterizedby social inequity and to change them, generating a new equilibrium that corresponds to better conditions for a group of people. These authors therefore recognized a role of creative destruction for social entrepreneurship, which involves changing the status quo and redefining social balances, as in the Schumpeterian vision the innovation brought by the entrepreneur undermines the market rents.

This is an interesting aspect because, even if the actual impact dimension of social entrepreneurship is still to be evaluated, we note how it can be linked to two aspects: the direct effect, i.e., the immediate change generated by the business social entrepreneur; the indirect effect related to the attention that this activity arouses toward specific social problems and toward innovative ways to deal with them.

This emphasis on the extent of the effects that can be generated by social entrepreneur- ship and on the supremacy of this form of social change corresponds to which, with prevalent regard to that environmental sustainability issues. Hall et al. defined as a "panacea hypothesis", i.e., the idea that through entrepreneurship it is possible to reach a solution to the problems of society. At present, however, this actually turns out to be just a hypothesis, yet to be adequately tested and against which, as mentioned above, important questions also arise about the direction of social change and the values that guide it.

differences that Despite the characterize the different approaches, the authors who are engaged in the study of social entrepreneurship have highlighted common themes that need to be taken into entrepreneurship Social consideration. combines the passion of a social mission with the entrepreneurial approach. Social entrepreneurship uses the principles of entrepreneurship to organize, create, and manage a business to bring about social change. They are change agents with a problem-solving mission. The social mission is the core of what distinguishes social entrepreneurs from classical entrepreneurs like entrepreneurs are [1]. Social entrepreneurs only they are driven by social improvementand not by profits.

To overcome the problem of a universal definition, we accepted the suggestion of Choi and Majumdar, namely, of considering social entrepreneurship as a concept of cluster, formed by sub-concepts: creation of value by the social entrepreneur, SE organization, and social innovation.

IMPACT OF COVID-19 ON INDIAN AGRICULTURE AND ITS SCENARIO" R Satyanarayana Murty, M.Com Lecturer in Commerce VSR Govt. Degree & PG College, Movva Cell No.:9989347339 Email Id:rsmurthy1971@gmail.com

Abstract

Due to the outbreak of major dangerous corona virus there is a question of existence of human life is creating now. Later it renamed as SARS-CoV- 2 by the International Committee on Taxonomy of Viruses (ICTV). Due to SARS-CoV-2 the chain of human life is on the way disposing. Due to arrival of Coronavirus in all over world its great impact on all of the sectors. Agriculture is the most important sector of Indian economy. India is an agriculture based country, where more than 50% population is depending upon agriculture. The commitment of agribusiness in the national income in India is all the more subsequently; it is said that the agriculture in India is the backbone for Indian economy. Due to arrival of Coronavirus in all over world its great impact on all of the sectors. The agricultural response & its role is now becoming very important scenario. Due to coronavirus battle the contribution of Agriculture in Indian economy is going of descending order. In the Lockdown period, there were many challenges were created against the agricultural community. It deeply affected on Indian economical system also.

Key words: Covid-19, ICAR, GDP &

Lockdown.

INTRODUCTION

Already the world is facing against the peculiar dispute like as global warming . inadequacy of renewable energy resources etc. with augmentation in the populace: there is extremity to accomplish their gigantic arrogation for the sources. In accession to these, in the opening of the 2020, there is a colossal warfare is stand against the whole world. A new strife is produced known as the Corona virus disease; due to which plenty of people in the world get deceased. Chinese researcher detached sequencing of Corona virus and World Health Organization (WHO) available it to the research labs in various countries for the (Polymerase Chain Reaction) PCR test 1

In Dec.2019, a pneumonia outbreak was reported firstly in Wuhan city, China. The outbreak was traced to a novel strain of corona virus which was given the name 2019-CoV-2 by the World Health Organization (WHO) & later renamed as SARS-CoV-2 by the International Committee on Taxonomy of Viruses (ICTV). The Wuhan strain has been identified as a new strain of

Beta corona virus from group 2 beta with the approximation 70% genetic similarity to bat corona virus. The world is suffering from a small pieces of diameter 65-125nm and length of about 26-32 kbs.2 AS up to date 28 May, in the India there are about 165799 number of cases were confirmed & 4706 were deceased. And Overall in Maharashtra specially 59546 were confirmed & 1982 are deceased. As the symptoms of this infectious disease seems to be normal but its impact is very precarious to human body. The age group of the corona infectious people is superlative begin between the 40 to 60 years. This is the worst intense pandemic, after 1918-19 flu in which almost one third of the world's population was infected and 50 million causalities were reported². Due to swift hike of this virus, the India has also took a great attention & perceptions about this. The Indian government takes a first lockdown period from 25 March to 3 May & suggests a social distancing. Now up to date 28 May,4th lockdown is doing. On the 11th March 20, Covid-19 affirmed as pandemic. India is the 2nd topmost country in the world as per the population is concern. Analogues to that India took a great contribution to world in the Agricultural scenario also. Due to the lockdown

period, the contributions from agricultural sector becoming less now; because some restrictions & problems were created. Due to lockdown announced by the Indian government, the economy may slow over the next few months for most agricultural transport system business. Due to the Corona virus its impact on the Indian economy. trade. E-Commerce. International Industrial Service, Tourism sector & also on the agricultural sector also. The Nation wise lockdown has entrenched the economic system. A sector is facing a lot of trouble with laborers & transport of goods and carriers. All the issues were initiate only due to the SAR-CoV-2 & its meticulous analysis about the agricultural sector were reported in it. The study models local and cross -city transmission of the novel coronavirus in china between Jan 19 & Feb 29, 2020. We examine the role of agriculture sector in the Indian economy.3At the beginning, the Pre- Covid- 19 economy was at the point easing back down, of issues existing aggravating provincial wages, joblessness, low trouble, ailing, health and far reaching disparity.

Impacts

The impact of COVID-19 on the economy

is no doubt devasting. .No sector has free its impact. Its impingement on agriculture is critical and varied across the disparate segments that form the agricultural value string. Alike amid the different segments, its impact extensively among the various quarters and the producers and agricultural wage laborers. This impact will reverberate athwart the huge economy and will lengthy than few months. ⁴Agriculture is the most crucial sector of Indian economy. Indian agriculture sector accounts for 18 per cent of India's gross domestic product (GDP) &provides employment to 50% of the countries workforce. India is the world's largest manufacturer of pulses, rice, wheat, spices & spice products. India has lot of field to cast for business such as dairy, meat, poultry, fisheries, & food grains etc. India has materialize as the second largest producer of fruits & vegetables in the world 5

Impacts on Indian Agriculture Double hit due to lockdown

Indian agriculture quarter, which deteriorate latterly due to uneven monsoon, will face another hit due to the interruption from the corona virus. As rabbi harvest season, farmer worry about their standing crops. Farmers growing wheat. mustard, pulses, already complained about their crops damage due to untimely & heavyrainfall recently. This leads to the farmer's lockdown most of the laborers available goes to their homes Moreover farmer fear the sowing of summer season crops none of shop selling seeds, fertilizer & other vital input Besides several farm machines like combine & harvesters lie stranded on the highways as there is no one to operate them.⁶

The Union Home Ministry, in an extremely noteworthy move, has informed to reject development of ranch workers and collecting and planting related machines from the domain of lockdown Making the nourishment grains, products of soil and other basic things accessible to shoppers ,both in provincial and urban regions, is the most basic test for Government hardware during the lockdown time frame. 7During these challenging times, how does Indian agriculture respond to the crisis and how do government measures the affect the 140 million farm households across the country and thereafter impact the economy of a very important country in the assess the We developing world? immediate challenges that COVID-19 has posed to the farm sector and suggest the ensure 1 to mitigation measures sustainable food system in the post crisp Finance Minister period. The Indian

declared an INR 1.7 trillion package, mostly to protect the vulnerable sections including farmers from any adverse impacts of the corona pandemic. The announcement, among a slew of benefits. contained advance release of INR 2000 to bank account of farmer bas an income support under PM KISAN scheme. The government also raised the wage for workers engaged under the NREGS. world's largest wage guarantee scheme. Under the special scheme to take care of the vulnerable population, Pradhan Manti Garib Kalyan Yojana, (Prime Minister scheme for welfare of the poor), has been announced. Additional grain allotments to register beneficiaries were also announced for the next three months cash and food assistance to persons engaged in the informal sector mostly migrant laborers , have also been announced for which a separate PM- CARES (Prime Minister Citizen Assistance and Relief in Emergency Situations) full has been created

Immediate challenges

In spite of all these measures and in view of continuing restrictions on movements of people and vehicular traffic, concerns have been raised regarding negative implications of Covid 19 pandemic on the farm economy. This is the peak of rabbi season in India and crops like wheat, gram, lentil, mustard, etc. (Including the paddy in irrigated tracts) are at harvestable stage or almost reaching maturity. This is also the time when the farm harvests reach the mantis (market yards) for assured procurement operations by designated government agencies. Moreover, any severe disruptions to the supply of perishable fruits and vegetables , dairy products, fish etc. having mobilized to meet the increasing demand from bulging middle class as well as urban and rural consumers , may create irreparable damage to all actors in in the supply chain . The migration of workers from few parts to their native place has also triggered panic buttons, as they are crucial for both harvesting operations and post-harvest handling of produce in storage and marketing centers. The Union Home Ministry, in a very significant move, has notified to exclude movement of farmers, farm laborers and harvesting and sowing the related machines from the purview of lockdown.

Making the food grains, fruits and vegetables and other essentials items available to consumers, both in rural and urban areas, is the most critical challenge for Government machinery during the lockdown period. Smooth functioning of the supply chain, with the adequate safety measures for the people involved, is of paramount importance. Transportation of public distribution system (PDS) items to be ensured by respective Government agencies. Distributions of the commodities to while vulnerable population. maintaining prescribed guidelines and protocol, particularly of social distancing, must be effectively monitored. As the ongoing lockdown coincides with the rabbi harvesting season, farmers across the country look up to the Government to ensure uninterrupted harvesting of the crops as well as the smooth procurement operations. The Union Home Ministry's circular waving restrictions on inter state movements of farmers or laborers as well as harvesting and related farm machines, is indeed a step in right direction. While ensuring availability of laborers for critical farms operations, their safety (from any COVID infection) and welfare must be prioritized by the government systems.

The sale of dairy products, fish, poultry, etc. has also been hit during the lockdown period as the uptake by the organized industry plays has been affected due to shortage of workforce and transport issues. As weather has been very erratic over past few months in many parts, harvested produce must also be protected from such risk 11

Role of agriculture in Indian economy

- A major portion of National income comes from agriculture.
- Agriculture provides raw materials to industries.
- 3. It creates employment opportunities.
- Agriculture plays a crucial role in our international trade.
- 5. It creates the infrastructural facilities.
- 6. Importance for industrial development.
- Agriculture feeds the large population for our country.

Agriculture in India

- 1. Total Geographical Area- 328 million hectares
- 2. Net Area Sown- 142 million hectares
- Gross cropped Area- 190.8 million hectares
- Provides food to more than 1 billion people
- Contributes to 1 to 6th of the export earnings.

India in world of agriculture

- Largest producer of milk, cashew nuts, coconut, tea, Ginger, Turmeric & Black pepper etc.
- Largest cattle population 281 million.
- Second largest producer of wheat, Rice, Sugar, Groundnut & pulses.
- Third largest producer of Tobacco.
- > Third largest in implementation of

00

mechanization.12

The GDP of agriculture in Indian Economy is described statistically as follow as:

India's Response

The ongoing health crisis around Covid-19 has affected all walks of life. Protecting lives of people suffering from the disease as well as frontline health responders have been priority of nations. The Governments have been priority of nations. India declared a three week nationwide lockdown till mid- April in the initial phase which was subsequently.

During this challenging time, how does Indian agriculture respond to the crisis & how do government measures the affect 140 million farm house hold across the country in the developing world? We assess the immediate challenges that Covid-19 has posed to the farm sector & suggest mitigation measures to ensure a sustainable food. 1 Government support to the Indian agricultural sector

- Renouncing the blue print of National bank for agriculture and Rural Development (NABRD) will be more expanded.
- Reassuring states to initiate agricultural laws, measures for the 100 waterunderline districts, PM Kisanm scheme and equitable use of fertilizer.

- Krishi UDAAN game plan will be by Aviation Ministry.
- Horticulture zone with its current produce outstrip production food grains.
- Augmentation in the milk production of 5.3 million tons to 103 million tons by2025.
- Government will embroil youth in fishery sector.
- The government allocated 2.83 lakh crore rupees for agriculture and allied activities, irrigation and rural development in 2020-2021 budget by Nirmala Sitaraman.
- One product One District for immense spotlight to give strength to horticulture.
- Sagar Mitra for coastal states like Bengal and Tamil Nadu; interest coastal youth by dint of jobs and entrepreneurship in fish processing.
- Artificial insemination for domestic to be increased to 70% from the present

CONCLUSION

Due to such major battle like as the corona virus, it deeply affected on the human life. There is not only question of human struggle for existence is doing but also there is a disturbance on various factors one of them is its impact on Indian Agriculture. The Indian Government deliver message to all Indians as "Stay Home Stay Safe" to aware from this battle. There is much great contribution of Agriculture sector in Indian economy but 6 due to lockdown its impact & some 7. challenges were stands which all reported in it. But the great one thing is there is a big support gives to agriculture sector by Indian Government they were also reported. All Indians are thankful for that.

About the Editor

Dr.D.Uma Rani, M.A,Ph.D., is presently working as the Principal at Govt. Degree College, Avanigadda. Earlier she worked as Principal at GDC, Tiruvuru and as a Reader in English, at SRR&CVR Govt. Degree College, Vijayawada and V.S.R. Govt.Degree College, Movva. She 's a GOLDMEDALIST for Ph.D from Nagarjuna University in 2003 is also a recipient of TEACHER TRAINER CERTIFICATE in CLT by U.S.STATE Department and CCE in 2006 . She has rendered 28 years of service as a Lecturer in English grooming young minds towards excellence guiding 6 MPhils and 1 PhD. She is a dynamic lady with a versatile profile rendering service as the coordinator for Women Empowerment cell while working as lecturer acted as NSS P.O. at GDC, Bhadrachalam. JKC Coordinator at GDC-Bhadrachalam & Movva, P.I.O. for right to information committee, BOS Member for Krishna University, Machilipatnam, & K.B.N.College, Vijayawada, Guided Dissertatons of M.SC, in Value Education and Spirituality of DDE, Annamalai University, delivered many guest lectures etc.

She is diligent at work with a vision to provide holistic education. Being an ardent reader band critic of literature she believes that literature has a great influence on both individuals and society and it can inculcate great qualities like leadership in the individuals. Leadership is not about glorious crowning acts. It's about keeping your team focused on a goal and motivated to do their best to achieve it, especially when the stakes are high and the consequences really matter. It is about laying the groundwork for others' success, and then standing back and letting them shine. This idea is the driving force behind this compilation.

The work aims at throwing light on the genesis of nationalistic ideology in the days of freedom struggle so that it becomes easier for the present generation to understand it's true spirit.

Foreword

Nothing reflects the society better than literature. So also, the Freedom struggle for the present generation is better explained through literature. The present work is planned and aims at throwing light on various writings having the influence of Freedom struggle in any part of its literary creation, there by highlighting the essential spirit of Nationalist Movement, so that the present generation, will understand the roots of democratic India. As we celebrate 75 years of Independence – Azadi ka Amrith Mahotsav, it would behoove us to remember the role of pre-Independence literature in our freedom struggle.

The uniqueness of the book is that it has invited analysis/review on writing in other Indian languages which have Freedom struggle as an integrated part in its theme or characters. Those works speaking of the unsung heroes of our greatest struggle are very much entertained. It is an attempt to recall and remember forgotten heroes of our freedom struggle, many of whom might be renowned yet unknown to the new generation. The aim of recreating and bringing forth stories, which lay as faded memories of the past, shall serve as a medium of inspiration and encouragement for the coming generations. It encompasses all spheres of life, most of all by enriching our hearts and souls. The spirit of India is incomplete whilst we take our unsung heroes along this journey of growth and development. Their ethos and principles ought to be recalled and respected as done in the compilation of the book consists of papers presented by the participants of the seminar conducted as a part of the celebration of of Azadi ka Amrithmahotsav

- They Mirrored the Struggle.

CHAPTER-09

INDIAN ENGLISH LITERATURE WITH FREEDOM STRUGGLE

S.Kiranmayi

Lecturer In Electronics V.S.R Govt. Degree & PG College, Movva

Abstract

Literature played a significant role in the struggle for India's freedom. Beginning with the 19th century, when nationalist ideas began to emerge and literature in different Indian languages entered its modem phase, more and more writers began to employ literature for patriotic purpose. Most of them, in fact, believed that because they belonged to an enslaved country, it was their duty to create Literature of a kind that would contribute to the all-round regeneration of their society and pave the way for national liberation. Even when freedom from the British rule had not yet emerged as a programme of any major political organisation or movement, and the Indian National Congress was concerned only with constitutional agitation, the realisation of subjection and the need for freedom had begun to be clearly expressed in literature. With the passage of time, as the freedom movement began to attract larger sections of the people, and the demand for freedom became more insistent, literature strengthened the growing idealism of the people. But it also did something more. Besides inspiring people to

60 Indian English Litera ture With Freedom Struggle As Background

make all kinds of sacrifices for the cause of the country's liberation, literature also brought out the weaknesses of the nationalist movement and its leaders. The ideology, thought and writings of great men of letters shaped the great freedom movement of India. During the days of freedom struggle several men of letters produced creative works which inspired nationalism and patriotism among people.

The paper aims to examine the vision of Tagore, Mahatma Gandhi, Mulk Raj Anand, Sarojini Naidu and Jawaharlal Nehru and anti colonialism in Indian English writings before and after Independence.

Tagore

The powerful patriotic spirit of Tagore's literary works brought him in the mainstream of the freedom struggle and earned him national wisdom. He not only gave importance on political freedom but also spiritual freedom. Tagore in his poem, "where the mind is without fear" writes:- Where the mind is led by thee into ever-widening Thought and action into that heaven of freedom My father, let my country awake. His works generated a spirit of liberating India from colonialism. He was on a poetic mission to save India from slavery. His works ignited passion and united people to dedicate them to the national struggle. He opposed the partition of Bengal along communal lines and hated the idea of division of his beloved state. He advocated for Swadeshi, composed soul – stirring songs, addressed meetings and led protest marches.

Tagore suggested the people of country to get freedom on humanitarian grounds. "It is my conviction that my countrymen will truly gain their India by fighting against the education which teaches them that a country is greater than the ideals of humanity". He opposed the ideas of nationalism initiated from West. Tagore gifted to India her national anthem. The song generated a sense of national unity during the days of freedom struggle which made India stronger than before. He was a seer and national builder and his contribution of his songs to the national freedom was immense.

Indian English Literature With Freedom Struggle 61

Mahatma Gandhi

Great men die physically, but continue to live in the memories of people by their actions and work. Mahatma Gandhi was one of such men among others. Mahatma Gandhi is such a socio-political figure who is barely impossible for someone to forget or ignore. He influenced every aspect of human consciousness and became a source of writing in different fields like history, politics, philosophy, literature, sociology and so on. Indian English Literature echoes 'Gandhian Consciousness' both in pre-independence and post-independence period. Mahatma Gandhi and his ideology dominated literature of twentieth century and continued to have its presence even on today's literature. Kai Nicholson observes in his book A Presentation of Social Problems in the Indo-Anglican & the Anglo-Indian Novel, "A character who has loomed large in Indo-Anglican fiction during and after his life time is Mahatma Gandhi." (Kai, 239). Gandhi's philosophy and life became an example and an ideal for most great people of the world to lead a comfortable life.

Many great people like Nelson Mandela, Dalai Lama have confessed about the influence of Gandhian ideology and philosophy on them and their work. His influence was all pervasive and inescapable. Gandhian ideals like 'Ahimsa' (non-violence), 'Satyagraha' (insistence of truth) and non-violent ways of struggle like boycott of English things and lifestyle have had a tremendous impact on the political movements of the world. Even the life of Mahatma Gandhi was quite impressive his saint-like austerity, limited needs that have instilled a new sense of pride and purpose for Indians and foreigners.

Jawaharlal Nehru

Jawaharlal Nehru was an important leader of Indian Independence Movement and Indian National Congress. He became the first Prime Minister when India won its independence on August 15, 1947. He served as the country's prime minister for 16 years. Nehru promoted parliamentary democracy, secularism, and science and technology

62 Indian English Litera ture With Freedom Struggle As Background

during the 1950s, powerfully influencing India's arc as a modern nation and also two important works of Jawaharlal Nehru are 'Discovery of India' and 'The Glimpses of World History'. "The Discovery of India" contains the historical facts are mentioned chronologically which gives a beautiful perspective on India – the past and the pre-independence era. "The Glimpses of World History" contains important aspects of the history of humankind from <u>Ancient Greece</u>. During the 1920s and 1930s Nehru was repeatedly imprisoned by the British for civil disobedience. In 1928, he was elected president of the Congress. By the end of World War Two, Nehru was recognised as Gandhi's successor. He played a central role in the negotiations over Indian independence.

Nehru advocated state-sponsored industrialisation, increasing the "wealth-producing capacity" and using atomic energy for civilian use. But he realised that for industrialisation to be viable it needed a supportive agrarian economy and a small-scale industrial base.

Mulk Raj Anand

Mulk Raj Anand, (born December 12, 1905, Peshawar, India [now in Pakistan] died September 28, 2004, Pune), prominent Indian author of novels, short stories, and critical essays in English, who is known for his realistic and sympathetic portrayal of the poor in India.

Mulk Raj Anand came into the field of literary writing after facing a family tragedy related to the rigidity of India's caste system. In his debut written essay, he responded to an aunt's suicide after her family had excommunicated her for having a meal with a Muslim woman.He started his writing career in England by writing some short reviews in S. Eliot's magazine, 'Criterion'.During the 1930s and 40s, he actively took part in politics and gave many speeches at the meeting of the Indian League.

In 1935, his first novel 'Untouchable' was published which expose the dark side of India's untouchable caste system. The novel is beautifully written by using Hindi and Punjabi idioms in English. This experiment captured the vernacular inventiveness and gave Mr. Anand, the reputation of India's Charles Dickens.

In the same year, he founded the Progressive Writers' Association along with other two writers Sajjad Zaheer and Ahmed Ali.In 1937, Anand Ji joined the International Brigade in the Spanish Civil War. During this period, he wrote numerous essays and articles onvarious political issues. From 1939 to 1942, he began lecturing in literature and philosophy at London County Council Adult Education Schools and the Workers' Educational Association.

During the 1930s and 40s, he gave his time to the politics of London and India. He was an active member of the Indian National Congress as well as the British Labor Party.During World War II, Mulk Raj Ji worked as a scriptwriter and broadcaster also in the film division of BBC London.In 1946, he launched the magazine about fine arts named 'Marg' which was mainly funded by JRD Tata and later got financial support from Tata Group.In 1947, Anand Ji came back to India.From 1948 to 1966, he spent his time teaching at various universities. In the 1960s, he served as a professor of Literature and Fine Arts at the University of Punjab.

From 1965 to 1970, Mr. Anand served as the fine art chairman at Lalit Kala Akademi.

In 1970, he also became the president of Lokayata Trust after which he created a community and cultural center in Hauz Khas village, Delhi.In the same year, he joined the International Progress Organization (IPO) working on the issues related to cultural selfawareness among countries.

Sarojini Naidu

Sarojini Naidu was an Indian political activist and poet. A proponent of <u>civil rights</u>, <u>women's emancipation</u>, and <u>anti-imperialistic</u> ideas, she was an important person in <u>India's struggle for</u> independence from colonial rule. Naidu's work as a poet earned her the sobriquet 'the Nightingale of India', or 'Bharat Kokila' by Mahatma

64 Indian English Litera ture With Freedom Struggle As Background

Gandhi because of colour, imagery and lyrical quality of her poetry. After some experience in the suffragist campaign in England, she was drawn to India's Congress movement and to Mahatma Gandhi's Noncooperation Movement. In 1924 she travelled in eastern Africa and South Africa in the interest of Indians there and the following year became the first Indian woman president of the National Congress-having been preceded eight years earlier by the English feminist Annie Besant. She toured North America, lecturing on the Congress movement, in 1928–29. Back in India her anti-British activity brought her a number of prison sentences (1930, 1932, and 1942-43). She accompanied Gandhi to London for the inconclusive second session of the Round Table Conference for Indian–British cooperation (1931). Upon the outbreak of World War II she supported the Congress Party's policies, first of aloofness, then of avowed hindrance to the Allied cause. In 1947 she became governor of the United Provinces (now Uttar Pradesh), a post she retained until her death.

Sarojini Naidu also led an active literary life and attracted notable Indian <u>intellectuals</u> to her famous salon in Bombay (now <u>Mumbai</u>). Her first volume of <u>poetry</u>, *The Golden Threshold* (1905), was followed by *The Bird of Time* (1912), and in 1914 she was elected a fellow of the Royal Society of Literature. Her collected poems, all of which she wrote in English, have been published under the titles *The Sceptred Flute* (1928) and *The Feather of the Dawn* (1961).

CHAPTER-26

MANIFESTATION OF PATRIOTIC FERVOUR IN SAROJINI NAIDU'S POEM COROMANDEL FISHERS

Dr.S. Madhavi

Principal

V.S.R.G.D.C, Movva

Dr. A.V.V.Malleswaramma

Lecturer In English

V.S.R.G.D.C., Movva

Patriotism is defined as love of one's country, recognition with it, and singular apprehension for its welfare and that of fellow citizens. Patriotism is based on Greek patriStçs, which is recorded in the 1500s. It means "fellow-countryman or lineage member." The most basic description of patriotism is defined as a group's loyalty towards their members and the land they share in living. According to Nathanson a professor in Philosophy:

Patriotism consists of 4 main components which are a special affection towards one's country; defining himself or herself through his or her country; being interested in country's welfare; and sacrificing for the sake of country's welfare. So patriotism is a feeling of attachment and commitment to a country, nation, or political community. ¹

One can find these elements in the literature during the freedom struggle in India. The pre-Independence Indian English literature during the freedom fight plays a great role to hearten and initiate the spirit of freedom in people. The poets/writers like Henry Derozio, M.M.Dutt, Sarojini Naidu, Rabindranath Tagore, Bankim Chandra Chattopadhyay,

194 Indian English Litera ture With Freedom Struggle As Background and others infused patriotism and augmented the freedom struggle through their works. Among them Sarojini Naidu needs no special introduction in the field of Indian English poetry. She was hailed from a prestigious Bengali literary family. She was a celebrated political activist, feminist, and poet. She was the first Indian woman to be president of the Indian National Congress. She was a promoter of civil rights, women's liberation, and anti-imperialistic ideas. Sarojini Naidu as a poet belonged to an era of struggle, slavery, and freedom fighting. Mahatma Gandhi gave her the sobriquet ' the Nightingale of India because of the imagery and lyrical quality in her verse. Some of her famous poems are Ecstasy, Indian Dancers, The Indian, In The Forest, Palanquin Bearers etc. Her poems were admired by many prominent Indian politicians. Her language was simple and provoked patriotic feelings. She had also portrayed the beauty of nature and its importance to one's life through her poems. She was remarkably inspired by prominent thinkers and writers like Rabindranath Tagore and Gopal Krishna Gokhale. She used all these influences to portray her ideas and feelings of patriotism in her poetry. The poems like The Gift of India, An Anthem of Love, and The Coromandel Fishers reflected her patriotic fervor towards mother India and the freedom struggle. The components of patriotism mentioned by Nathan were reflected effectively in the poem Coromandel Fishers. They were: a singular liking for motherland, defining oneself through the poet's country, being engrossed in country's welfare and sacrificing for the sake of country's benefit.

Coromandel Fishers is a scintillating example of her patriotic call given to Coromandel fishers. Though the poem is about the fishermen, it metaphorically reflects the poet's desire for free India and thus she encourages the people of the nation to hasten their struggle. The first stanza shows a special affection towards her motherland. It is a complicated yet very beautiful poem written by Sarojini Naidu. This poem depicts the bond between the fishermen of the Coromandel Coast and the sea. She has personified nature in the best possible way. The theme of the poem is that a fisherman/woman encouraging his fellow fishermen to get to work by the dawn. The hard life style of the fishermen and their meager earnings are beautifully portrayed by her. She also focused on the socio-political status of the freedom struggle in operation at that time. She metaphorically compares the fishermen to Indian and their stressful yet beautiful life to the freedom struggle. As a fellow fisherwoman she encourages them to rise and go for fishing on sea i.e. fight for freedom of India. They face the turbulent sea every day for their livelihood, and likewise they had to face the British to earn freedom from their clutches. She addresses them:

Rise, brothers, rise; the wakening skies pray to the morning light,

The wind lies asleep in the arms of the dawn like a child that has cried all night.

Come, let us gather our nets from the shore and set our catamarans free,

To capture the leaping wealth of the tide, for we are the kings of the sea!

She calls them brothers and requests them to rise because it is already morning now i.e. it is the time the land is welcoming the independence. As the struggle is continuing, It's the duty of the countrymen to participate in it. The line "the wakening skies pray to the morning light," symbolizes it. The personification and the simile the used in this line 'The wind lies asleep in the arms of the dawn like a child that has cried all night' denotes the temporary rest taken by the children i.e freedom fighters fall asleep at night after fighting all day like the fierce wind. It also refers to the atrocities that the people had suffered in the hands of the British during their cruel rule. With independence that suffering will vanish away. They should rise from the sleep now and gather all their strength like the fishermen gathering their nets and set for their goal. The poet praises the fishermen as 'the kings of the sea' because they possess the wealth of the sea, the fishes and all the treasures of the sea world. These lines refer to the treasures of India and so all Indians are kings. The real treasure will be the independence. Here she is singing as a fisherman addressing *Indian English Litera ture With Freedom Struggle As Background* his brethren about the life and attitude of the fishermen of the Coromandel Coast on the Bay of Bengal.

Sarojini Naidu's loyalty and her attachment towards India is reflected in some lines of this poem. This attachment can be a combination of many different feelings and language relating to one's own homeland, including ethnic, cultural, political or historical aspects. Loyalty towards one's own country above one's family is a usual phenomena during the times of Indian freedom struggle. It depends on the patriot's beliefs on the country of his/her birth. Thus the loyalty towards motherland is described emotionally in the above lines. Simon Keller argues:

Whereas one's love of and loyalty to a family member or a friend may coexist with a low estimate of the person's qualities, patriotism involves endorsement of one's country. If the patriot is to endorse his country, he must consider his beliefs about the country's virtues and achievements to be based on some objectively valid standards of value and an unbiased examination of the country's past and present record that leads to the conclusion that it lives up to those standards. ²

Sarojini leads further and tries to show her interest towards the country by supporting them morally. The poet insists the fishermen to be active to go for fishing. She writes:

- No longer delay, let us hasten away in the track of the sea gull's call,
- The sea is our mother, the cloud is our brother, the waves are our comrades all.
- What though we toss at the fall of the sun where the hand of the sea-god drives?
- He who holds the storm by the hair, will hide in his breast our lives.

Manifestation of Patriotic fervour in Sarojini Naidu's poem Coro--- 197

The poet explains them that they will be tossed with the waves somewhere in the mid-sea, they needn't fear because they would be at the mercy of the waves, even where the sea god Neptune controls everything. He will protect their lives because he has a strong hold on storm. Here the God Neptune may refer to the Leaders of Freedom movement. Though the struggle is a difficult one for a common man, they need not fear because the national leaders have controlling power on the movement. They will protect like a parent. She calls 'the sea' our mother; the 'clouds' our brothers and the waves as our comrade. Thus she metaphorically claims that India is the motherland of all Indians and the people belong to one family. So they will be protected from the mother-god from the 'wind' i.e. the foreign rulers.

The last lines of the poem picturises the poet's sacrificing quality, for the sake of country's welfare. She voices out the feelings of the fishers/patriots:

Sweet is the shade of the cocoanut glade, and the scent of the mango grove,

And sweet are the sands at the full o' the moon with the sound of the voices we love;

But sweeter, O brothers, the kiss of the spray and the dance of the wild foam's glee;

Row, brothers, row to the edge of the verge, where the low sky mates with the sea.

The final stanza elaborates that the comforts and the joys the Indians enjoy is sweet but the comforts after independence will be sweeter. So the Indians has to wage the final war on the British.

A patriot doesn't care much for the troubles they face like the fishermen for whom 'the kiss of spray wash and the dance of the wild waves are sweeter. It is due to their love of sea as well the love of the country. They are ready to face troubles for the sake of the country. The poet defines herself through her country, which bears the dedicated children like her. Majority of Indians like Sarojini Naidu are greatly *198 Indian English Litera ture With Freedom Struggle As Background* influenced by the rich culture and heritage of India. They call the nation their mother and ready to inspire the fellow countrymen to participate in the freedom struggle as well prepare to sacrifice their lives to see liberated India. As an inspiring writer during the period of India's struggle for Independence, Sarojini's major aim is to wake up the minds of the freedom fighters.

Chapter 1 : Concepts of Abstract Data types	1
L Data tripas	1
2. Data structuras	3
2. Data structures 2. Primitive and Non-Primitive data structures	4
4. Linear and Non-Trimine data structures	5
4. Elledi and Non-Elledi Data shattar	
Chapter 2: Linear Lists	8
Chapter 2. Emetal 2000	8
5. Abstract data types	10
6. Array and Linked representation of linear lists	13
7. Pointers	1
Chapter 3: Arrays	15
	15
8. Array abstract data type	16
9. Array	16
10.Sparse matrices	18
11.Single linked list	21
12. Doubly linked list	22
13. Circular linked list	23
14. Applications of Linkea lists	
Chapter 4: Stacks	25
	25
15. Stack ADI	25
16. Stack and stack operations	28
17. Array and linkea representation of stack	32
18. Applications of stacks	

47

54

65

65

Chapter 5: Queues

19 Quene 101	34
20 Queue and Queue operations	14
21 Array and linked representation of Queues	34
22 Circular Queues	37
23 Dequenc	40
24. Priority queues	43
25 Applications of Queues	44
	45

Chapter 6: Trees

26 Internetion	
20. Introduction	47
27.Binary trees	48
28.Tree ADT	50
29. Properties of Binary trees	51
30. Representation of Trees	52
31. Applications of Trees	53

Chapter 7: Binary search Tree

32. Introduction5433. Operations of Binary search tree5534. Applications of Binary search tree6135. Threaded Binary tree6236. Heap tree63

Chapter 8: Graphs

	0.
37.Introduction	66
38. Types of Graphs	68
39. Graph representation	70
40. Connected components of graphs	71
41. Basic searching techniques	78
42. Minimum spanning tree	

Chapter 9: Sorting and searching	-12
12 Selection soft	*2
44 Insertion sort	85
44. Insertion sort	87
43. Bubble Sort	90
46. Merge sort	92
47.Quick sort	94
48. Heap sort	96
49. Sequential search	00
50.Binary search

PREFACE

It gives us great pleasure to place the book 'Research Methods and Business Analytics' in your hands. The book is written strictly according to the M.Com. CBCS syllabus prescribed by Krishna University in Andhra Pradesh. The book has been thoroughly revised in the light of the new syllabus and latest examination question papers of different universities of Andhra Pradesh. In every chapter adequate theoretical explanation, short answer questions, essay answer questions and illustrations of M.Com, standard have been included to make the book more useful to the students. Sincere attempt is made to eliminate printing errors. we hope that the teachers and students will derive greater satisfaction from it.

We are thankful to Mr. Ch. kondal Rao, Mr.K. Brahma Reddy, Mr. M. Satyanarayana and M. Suniteja for the help rendered by them in publishing the book. We sincerely thanks to all lectures and students who have helped through by their valuable suggestions. We also thank Sri C.H. Anil Kumar VRL Publishers is a dedicated for the efficient and timely work done by them.

Constructive criticism and suggestions for improvement of the book are most welcome.

Authors

Syllabus

Research Methods and Business Analytics

Unit – I: Introduction to Research

Nature and Scope of Research Methodology – Research design – Types of Research Problem Formulation, Research Objectives – Hypotheses- Significance of Research in Commerce and

Management

Unit – II: Sources of Data and Sampling

Types of Sources: Primary and Secondary – Methods of Data

Collection – Questionnaire –

Schedule-Observation - Attitude Measurement Techniques -

Administration of Surveys -

Sample Design and Sampling Techniques.

Unit – III: Tabulation and Data Analysis

Tabulation and Cross Tabulation of Data: Univariate, Bivariate data - Analysis and Interpretation- Testing of Hypothesis-SPSS Packages and Applications.

Unit– IV: Multivariate Analysis

Advanced Techniques for Data Analysis: ANOVA, Discriminate Analysis, Factor Analysis,

Clustering Techniques, Report Writing.

Unit – V: Business Analytics

Evolution of Business Analytics - Master Data Management: Data Warehousing–Transformation and Up-loading of Data – Data Mining – Meta Data – Data Marts –Data Integration – OLTP and OLAP.

1.1. Introduction to Research:

The word research is composed of two syllables "Re" and "Search". "Re" is the prefix meaning 'Again or over again or a new' and "Search" is the latter meaning 'to examine closely and carefully' or 'to test and try'. Together they form, a careful, systematic, patient study and investigation in some field of knowledge undertaken to establish principles / policies. Research normally is referred to as a search for knowledge. It is a systematic and scientific search for pertinent information in relation to a particular subject. It is an art of scientific and systematic investigation.

Research is an academic activity. It comprises of defining and redefining problems, formulating hypothesis or suggesting solutions, collecting, organizing and evaluating data, making deductions, reaching conclusions and sensibly testing the solutions to determine, whether they are in accordance to the hypothesis that have been formulated. Research is thus an original contribution to the existing stock of knowledge, making it appropriate for utilization. It is the pursuit of accuracy and facts, with the help of study, observation, comparison and experiment. It is the search for knowledge, through objective and systematic method of finding solutions to a problem.

1.2. Meaning of Research:

Research in common parlance refers to a search for knowledge. Once can also define research as a scientific and systematic search for pertinent information on a specific topic. In fact, research is an art of scientific investigation. The Advanced Learner's Dictionary of Current English lays down the meaning of research as "a careful investigation or inquiry specially through search for new facts in any branch of knowledge."

1.3. Definitions of Research:

Research work is traditionally defined as gathering of data to answer the questions and finding solution to problems. Some of the definitions of research are:

- 1. 1 Redman and Mory define research as "a systematized effort to gain new knowledge."
- 2. According to Clifford Woody research comprises defining and redefining problems, formulating hypothesis or suggested solutions; collecting, organising and evaluating data; making deductions and reaching conclusions; and at last carefully testing the conclusions to determine whether they fit the formulating hypothesis.
- 3. D. Slesinger and M. Stephenson in the Encyclopaedia of Social Sciences define research as "the manipulation of things, concepts or symbols for the purpose of generalising to extend, correct or verify knowledge, whether that knowledge aids in construction of theory or in the practice of an art."

Research is, thus, an original contribution to the existing stock of knowledge making for its advancement. It is the pursuit of truth with the help of study, observation, comparison and experiment.

1.4. Characteristics of Research:

The major characteristics of any research are;

- 1. Objectivity,
- 2. Precision,
- 3. Design and
- 4. Verifiability.

Let us look at these attributes more closely:

1. **Objectivity:** Ideally, research is beyond the subjective bias of the researcher. The researcher makes deliberate efforts to eliminate personal preference resisting the temptation to seek only such data that supports his/her hypothesis. The emphasis is on testing, rather than proving the hypothesis. The researcher is willing to suspend personal judgement and permit the data and logic to lead independently to a sound conclusion. Objectivity is achieved through standardisation of research instruments, choosing appropriate research design and analytical tools and ensuring dependability of data.

- 2. **Precision:** Precision in scientific research is achieved through the uses of statistical methods and techniques. As such, research conclusions convey the exact meaning to the reader, e.g. measures of central tendency, variability, correlation, regression etc. are the most precise expression in quantitative research which explains or represents the truth. Precise language describes the study accurately so that the study may be replicated or the results correctly used.
- 3. **Design:** In a scientific research, the researcher has to have a specified design of carrying out the investigation.

Process of research design

Only if the research has been carried out by using a specified process, it can be replicated for verification.

4. Verifiability: This is an important characteristic of every research. Research methods and findings presented to the professional community for other researchers to analyse, confirm or reject them. Verifiability is achieved primarily through two different approaches: first, analysing the same data on the same sample through alternative analytical tools (statistical methods), and the second, replicating the study on a different sample.

1.5. Nature and Scope of Research Methodology:

Research is systematic and critical investigation of a phenomenon. It identifies the variables, collects and analyses data on such variables to find answers to certain crucial questions. These answers contribute further to increase human knowledge. Orderliness is the hallmark of research. Research has to have an organic unity. This becomes essential if the knowledge which accrues from research is to be verified; for, it must be verifiable by anybody who takes the trouble to do so. In fact, research is considered to be a formal, systematic, intensive process of carrying on the scientific method of analysis. It involves a more systematic structure of investigating, usually resulting in some sort of formal record of procedures and results or conclusions.

1.6. Research Design:

The most important step after defining the research problem is preparing the design of the research project, which is popularly known as the 'research design'. A research design is a logical and systematic plan prepared for directing a research study. It specifies the objectives of the study, the methodology and techniques to be adopted for achieving the objectives.

The Research Design makes available the answers to various questions like

- 1) What is the design of a research?
- 2) What type of data is required?
- 3) What are the measures and scales used?
- 4) What is the form of data collected such as questionnaire, schedule, and interview?

5) What is the size of sample and sampling procedure?

6) What are the techniques of data analysis?

1.6.1. The Definition of a Research Design:

A research design is a plan, structure and strategy of investigation so conceived as to obtain answers to research questions or problems. The plan is the complete scheme or program of the research. It includes an outline of what the investigator will do from writing the hypothesis and their operational implications to the final analysis of data. A traditional research design is blue print or detailed plan for how a research study is to be completed operational design variables so they can be measured, selecting a sample of interest to study. Collecting data to be used is a basis for testing hypothesis and analyzing the results. A research design is a procedural plan that is adopted by the researcher to validly objectively questions accurately answer and economically.

- **1. According to Seltiz of at**, "A research design is the arrangement of conditions for collection and analysis of data in a manner that aims to combine relevance to the research purpose which economy in procedure".
- 2. According to Kerlinger, "Research design is the plan, structure and strategy and strategy of investigation conceived so as to obtain answers to research questions and to control variance"

- **3. According to Bernard Philips** he research design "As a blue print for the collection, measurement and analysis of data".
- **4. According to Claire Seltiz**, "A research design is the arrangement of conditions for collection and analysis of data in a manner that aims to combine relevance to the research purpose with economy in procedure".
- **5.** According to S.L. Gupta and Hitesh, "A research design provides a flow of activities from problem formulation to hypothesis development to data collection to data analysis to final results to implications".

1.6.2. Features of Research Design:

The important features of Research Design may be outlined as follows:

- a) It is a plan that identifies the types and sources of information required for the research problem;
- b) It is a strategy that specifies the methods of data collection and analysis which would be adopted; and
- c) It also specifies the time period of research and monetary budget involved in conducting the study, which comprise the two major constraints of undertaking any research.

In view of the stated above research design decisions, the overall research design may be divided into the following (Kothari 1988):

- a) The sampling design that deals with the method of selecting items to be observed for the selected study;
- b) The observational design that relates to the conditions under which the observations are to be made;
- c) The statistical design that concerns with the question of how many items are to be observed, and how the information and data gathered are to be analysed; and
- d) The operational design that deals with the techniques by which the procedures specified in the sampling, statistical and observational designs can be carried out.

1.6.3. Need for Research Design:

Research design is needed because it facilitates the smooth sailing of the various research operations, Thereby making research as efficient as possible yielding maximal information with minimal expenditure of effort, time and money. Just as for better, economical and attractive construction of a house, we need a blueprint (or what is commonly called the map of the house) well thought out and prepared by an expert architect, similarly we need a research design or a plan in advance of data collection and analysis for our research project. Research design stands for advance planning of the methods to be adopted for collecting the relevant data and the techniques to be used in their analysis, keeping in view the objective of the research and the availability of staff, time and money. Preparation of the research design should be done with great care as any error in it may upset the entire project.Research design, in fact, has a great bearing on the reliability of the results arrived at and as such constitutes the firm foundation of the entire creation of the research work.

Even then the need for a well thought out research design is at times not realised by many. The importance which this problem deserves is not given to it. As a result many researches do not serve the purpose for which they are undertaken. In fact, they may even give misleading conclusions.Thoughtlessness in designing the research project may result in rendering the research exercise futile. It is, therefore, imperative that an efficient and appropriate design must be prepared before starting research operations. The design helps the researcher to organize his ideas in a form whereby it will be possible for him to look for flaws and inadequacies. Such a design can even be given to others for their comments and critical evaluation. In the absence of such a course of action, it will be difficult for the critic to provide a comprehensive review of the proposed study.

1.6.4. **Characteristics of a Good Research Design:**

A good research design has the following traits:

- 1. Possesses the qualities of being flexible, suitable, efficient, and economical and so on.
- 2. It research design which minimizes bias and maximizes the reliability of the data collected and analysed (Kothari 1988).
- 3. Research design which does not allow even the smallest experimental error
- Research design that yields maximum information and provides an opportunity of viewing the various dimensions of a research problem

Thus, the question of a good design relates to the purpose or objective and nature of the research problem studied. While a research design may be good, it may not be equally suitable to all studies. In other words, it may be lacking in one aspect or the other in the case of some other research problems. Therefore, no single research design can be applied to all types of research problems.

If the research study happens to be an exploratory or a formulative one, wherein the major emphasis is on discovery of ideas and insights, the research design most appropriate must be flexible enough to permit the consideration of many different aspects of a phenomenon. But when the purpose of a study is accurate description of a situation or of an association between variables (or in what are called the descriptive studies), accuracy becomes a major consideration and a research design which minimises bias and maximises the reliability of the evidence collected is considered a good design.

Studies involving the testing of a hypothesis of a causal relationship between variables require a design which will permit inferences about causality in addition to the minimisation of bias and maximisation of reliability. But in practice it is the most difficult task to put a particular study in a particular group, for a given research may have in it elements of two or more of the functions of different studies.

It is only on the basis of its primary function that a study can be categorised either as an exploratory or descriptive or hypothesis-testing study and accordingly the choice of a research design may be made in case of a particular study. Besides, the availability of time, money, skills of the research staff and the means of obtaining the information must be given due weightage while working out the relevant details of the research design such as experimental design, survey design, sample design and the like.

A research design suitable for a specific research problem would usually involve the following considerations:

- \succ The methods of gathering the information;
- The skills and availability of the researcher and his/her staff, if any;
- The objectives of the research problem being studied;
- The nature of the research problem being studied; and
- The available monetary support and duration of time for the research work.

1.6.5. The nature of Research Design:

The Research Design is an outcome of decisions taken and put in a sequence in respect of the study and the types of data needed, the rational for the study being made, the sources of data required, the study area, that time available for study, the material and the number cases need, the procedure of selection of the sample, the techniques of data Collection, the Analysis of data and the decisions articulated in a manner that the purpose of research is achieved with economy in money time and energy.

- 1. Convert the Research question and the stated assumptions/ hypotheses into operational variables that can be measured.
- 2. Specify the process that would be to follow to complete the task, as efficiently and economically as possible.
- 3. Specify the control mechanism that would be used to ensure that the effect of other variables that could impact the outcome of the study has been controlled.
- 4. Thus research designs have a critical and directive role to play in the research process. The execution details of the Research question to be investigated are referred to as the research design.

1.6.6. Purpose of Research Design

Research Design enables the researcher to answer research questions in a valid objective, accurate and economical way

- Research Design is worked out with care to yield reliable and valid answers to the research questions embodied by the hypotheses.
- Adequately planned and executed design assist greatly in allowing us to rely on both observation and inferences
- Research Design sets up the Framework for adequate tests of the relationship among variables

1.6.7. **Importance of Research Design:**

The need for a research design arises out of the fact that it facilitates the smooth conduct of the various stages of research. It contributes to making research as efficient as possible, thus yielding the maximum information with minimum effort, time and expenditure. A research design helps to plan in advance, the methods to be employed for collecting the relevant data and the techniques to be adopted for their analysis. This would help in pursuing the objectives of the research in the best possible manner, provided the available staff, time and money are given. Hence, the research design should be prepared with utmost care, so as to avoid any error that may disturb the entire project. Thus, research design plays a crucial role in attaining the reliability of the results obtained, which forms the strong foundation of the entire process of the research work.

The research design helps the researcher to organize his/her ideas in a proper form, which in turn facilitates him/her to identify the inadequacies and faults in them.

A research without a pre-drawn plan is like an ocean voyage without Mariner's compass. The preposition of a research plan for a study aids in establishing direction to the study and in knowing exactly what has to be done and how and when it has to be done at every stage.

It enables the researcher to consider beforehand the various decisions to be made.

➤ What are the objectives of the study?

 \succ What are the investigative questions?

➤ What are the sources of data?

➤ What is the universe of the study?

 \succ What sampling method is appropriate? And so on.

Without a plan, research work becomes unfocussed and aimless empirical wandering the researcher would find it difficult, laborious and time-consuming to make adequate discriminations in the complex inter plan of facts before him, he may not be able to decide which is relevant and which is not, The use of a research design prevents such a blind search and indiscriminate gathering of data and guides him to proceed in the right direction.

1.6.8. Concepts Relating to Research Design:

Some of the important concepts relating to Research Design are discussed below:

1. Dependent and Independent Variables:

A variable is any characteristic, number, or quantity that can be measured or counted. A variable may also be called a data item. Age, sex, business income and expenses, country of birth, capital expenditure, class grades, and eye colour and vehicle type are examples of variables.

2. Extraneous Variables:

The independent variables which are not directly related to the purpose of the study but affect the dependent variables, are known as extraneous variables. For instance, assume that a researcher wants to test the hypothesis that there is a relationship between children's school performance and their self-confidence, in which case the latter is an independent variable and the former, a dependent variable. In this context, intelligence may also influence the school performance.

3. Control:

One of the most important features of a good research design is to minimize the effect of extraneous variable(s). Technically, the term 'control' is used when a researcher designs the study in such a manner that it minimizes the effects of extraneous variables. The term 'control' is used in experimental research to reflect the restrain in experimental conditions.

4. Confounded Relationship:

The relationship between the dependent and independent variables is said to be confounded by an extraneous variable, when the dependent variable is not free from its effects.

5. Research Hypothesis:

When a prediction or a hypothesized relationship is tested by adopting scientific methods, it is known as research hypothesis. The research hypothesis is a predictive statement which relates to a dependent variable and an independent variable. Generally, a research hypothesis must consist of at least one dependent variable and one independent variable. Whereas, the relationships that are assumed but not to be tested are predictive statements that are not to be objectively verified, thus are not classified as research hypotheses.

6. Experimental and Non-Experimental Hypothesis Testing Research:

When the objective of a research is to test a research hypothesis, it is known as hypothesis-testing research. Such research may be in the nature of experimental design or non-experimental design. The research in which the independent variable is manipulated is known as 'experimental hypothesis-testing research', whereas the research in which the independent variable is not manipulated is termed as 'non-experimental hypothesistesting research'.

7. Experimental and Control Groups:

When a group is exposed to usual conditions in an experimental hypothesis-testing research, it is known as 'control group'. On the other hand, when the group is exposed to certain new or special condition, it is known as an 'experimental group'. In the afore-mentioned example, Group A can be called as control group and Group B as experimental group. If both the groups, A and B are exposed to some special feature, then both the groups may be called as 'experimental groups'. A research design may include only the experimental group to both the experimental and control groups together.

8. Treatments:

Treatments refer to the different conditions to which the experimental and control groups are subject to. In the example considered, the two treatments are the parents with regular earnings and those with no regular earnings. Likewise, if a research study attempts to examine through an experiment the comparative effect of three different types of fertilizers on the yield of rice crop, then the three types of fertilizers would be treated as the three treatments.

9. Experiment:

Experiment refers to the process of verifying the truth of a statistical hypothesis relating to a given research problem. For instance, an experiment may be conducted to examine the yield of a certain new variety of rice crop developed. Further, Experiments may be categorized into types, namely, 'absolute two experiment' and 'comparative experiment'. If a researcher wishes to determine the impact of a chemical fertilizer on the yield of a particular variety of rice crop, then it is known as absolute experiment. Meanwhile, if the researcher wishes to determine the impact of chemical fertilizer as compared to the impact of biofertilizer, then the experiment is known as a comparative experiment.

10. Experimental Unit(s):

Experimental units refer to the pre-determined plots, characteristics or the blocks, to which different treatments are applied. It is worth mentioning here that such experimental units must be selected with great caution.

1.6.9. Types of Research Design:

There are different types of research designs. They may be broadly categorized as:

(1) Exploratory Research Design;

(2) Descriptive and Diagnostic Research Design; and

(3) Hypothesis -Testing Research Design.

1. Exploratory Research Design:

The Exploratory Research Design is known as formulative research design. The main objective of using such a research design is to formulate a research problem for an in-depth or more precise investigation, or for developing a working hypothesis from an operational aspect. The major purpose of such studies is the discovery of ideas and insights. Therefore, such a research design suitable for such a study should be flexible enough to provide opportunity for considering different dimensions of the problem under study.

Usually, the following three methods are considered in the context of a research design for such studies. They are

- (a) A survey of related literature;
- (b) Experience survey; and
- (c) Analysis of 'insight-stimulating' instances.

2. Descriptive and Diagnostic Research Design:

A Descriptive Research Design is concerned with describing the characteristics of a particular individual or group. Meanwhile, a diagnostic research design a determines the frequency with which a variable occurs or its relationship with another variable. In other words, the study analyzing whether a certain variable is associated with another comprises a diagnostic research study. On the other hand, a study that is concerned with specific predictions with the narration of facts or and characteristics related to an individual, group or situation, are instances of descriptive research studies.

The research design in such studies should be rigid and not flexible. Besides, it must also focus attention on the following:

- a) Formulation of the objectives of the study,
- b) Proper designing of the methods of data collection,
- c) Sample selection,
- d) Data collection,

e) Processing and analysis of the collected data, andf) Reporting the findings.

3. Hypothesis-Testing Research Design:

Hypothesis-Testing Research Designs are those in which the researcher tests the hypothesis of causal relationship between two or more variables. These studies require procedures that would not only decrease bias and enhance reliability, but also facilitate deriving inferences about the causality. Generally, experiments satisfy such requirements. Hence, when research design is discussed in such studies, it often refers to the design of experiments.

1.7.Types of Research:

There are different types of research are as follows

1.7.1Descriptive Research:

Descriptive study is a fact-finding investigation with adequate interpretation. It is the simplest type of research. It is more specific that an exploratory study, as it has focus on particular aspects or dimensions of the problem studied.

Descriptive research consists of surveys and fact-finding enquiries of different types. The main objective of descriptive research is describing the state of affairs as it exists at the time of study. In social science and business research we quite often use. The term 'ex post facto research' is quite often used for descriptive research studies. The most distinguishing feature of this method is that the researcher has no control over the variables here. He/she has to only report what is happening or what has happened. Majority of the ex-post facto research projects are used for descriptive studies in which the researcher seeks to measure such items as, for example, the consumers' preferences, frequency of purchases, shopping, etc.

1.7.2. Analytical Research:

The researcher has to use the already available facts or information, and analyse them to make a critical evaluation of the subject. Analytical study is primarily concerned with testing hypothesis and specifying and interpreting relationships.

1.7.3. Applied Research (or) Action Research:

Applied research is carried on to find solution to a real life problem requiring an action or policy decision. It is thus problem oriented and action-directed. It seeks an immediate and practical result. The main objective of applied research is to find a solution to some pressing practical problem.

Applied research is an attempt to find a solution to an immediate problem encountered by a firm, an industry, a business organisation, or the society is known as applied research. Researchers engaged in such researches aim at drawing certain conclusions confronting a concrete social or business problem.

1.7.4. Fundamental Research (or) Basic (or) Pure Research:

Fundamental research mainly concerns generalizations and formulation of a theory. In other words, "Gathering knowledge for knowledge's sake is termed 'pure' or 'basic' research" (Young in Kothari, 1988). Researches relating to pure mathematics or concerning some natural phenomenon are instances of Fundamental Research. Likewise, studies focusing

28

on human behaviour also fall under the category of fundamental research. The main objective of basic research is to find information with a broad base of application and add to the already existing organized body of scientific knowledge.

By developing principle, pure research offers solutions to many practical problems. For example, Maslow's theory of motivation serves as a guideline for formulating incentive schemes and approaches to motivating employees in organizations. Generalizations have many practical applications. In fact, nothing is as practical for the goals of diagnosis or treatment as good theoretical research.

Pure research develops many alternative solutions and thus enables us to choose the best solution. By applying scientific knowledge developed by pure researches, various appliances like radio, television, refrigerator, computer etc. have been invented. Continuous basic research in these fields has contributed to the manufacture of more effective and useful models at the least cost.

1.7.5. Quantitative Research :

Quantitative research is based on the measurement of quantity (or) amount. It is applicable to phenomena that can be

29

expressed in terms of quantity.Various available statistical and econometric methods are adopted for analysis in such research. Which includes correlation, regression and time series analysis etc.

1.7.6. Qualitative Research:

Qualitative research is concerned with qualitative phenomena, or more specifically, the aspects related to or involving quality or kind.

For example, an important type of qualitative research is 'Motivation Research', which investigates into the reasons for certain human behaviour.

The main aim of this type of research is discovering the underlying motives and desires of human beings by using indepth interviews. The other techniques employed in such research are story completion tests, sentence completion tests, word association tests, and other similar projective methods.

Qualitative research is particularly significant in the context of behavioural sciences, which aim at discovering the underlying motives of human behaviour. Such research helps to analyse the various factors that motivate human beings to behave in a certain manner, besides contributing to an

30

understanding of what makes individuals like or dislike a particular thing. However, it is worth noting that conducting qualitative research in practice is considerably a difficult task. Hence, while undertaking such research, seeking guidance from experienced expert researchers is important.

1.7.7. Conceptual Research:

The research related to some abstract idea or theory is known as Conceptual Research. Generally, philosophers and thinkers use it for developing new concepts or for reinterpreting the existing ones.

1.7.8. Empirical Research:

Empirical Research relies on the observation or experience with hardly any regard for theory and system. Such research is data based, which often comes up with conclusions that can be verified through experiments or observation. Empirical research is also known as experimental type of research, in which it is important to first collect the facts and their sources, and actively take steps to stimulate the production of desired information. In this type of research, the researcher first formulates a working hypothesis, and then gathers sufficient facts to prove or disprove the stated hypothesis. He/she formulates the experimental design, which according to him/her would manipulate the variables, so as to obtain the desired information.

This type of research is thus characterized by the researcher's control over the variables under study. In simple term, empirical research is most appropriate when an attempt is made to prove that certain variables influence the other variables in some way. Therefore, the results obtained by using the experimental or empirical studies are considered to be the most powerful evidences for a given hypothesis.

1.7.9. Historical Research:

Historical research As regards to historical research, sources like historical documents, remains, etc. Are utilized to study past events or ideas. It also includes philosophy of persons and groups of the past or any remote point of time.

1.7.10. Decision-Oriented Research:

The decision-oriented research is always carried out as per the need of a decision maker and hence, the researcher has no freedom to conduct the research according to his/her own desires.

1.7.11. Conclusion-Oriented Research:

In the case of Conclusion-oriented research, the researcher is free to choose the problem, redesign the enquiry as it progresses and even change conceptualization as he/she wishes to. An operation research is a kind of decision-oriented research, where in scientific method is used in providing the departments, a quantitative basis for decision-making with respect to the activities under their purview.

1.8.Research Process:

Research process consists of a series of steps or actions required for effectively conducting research. The following are the steps that provide useful procedural guidelines regarding the conduct of research:

Research Process:

In other words, it involves the formal write-up of conclusions.

1.9. Research Problem:

The first and the foremost stage in the research process is to select and properly define the research problem. A researcher should first identify a problem and formulate it, so as to make it amenable or susceptible to research. In general, a research problem refers to an unanswered question that a researcher might encounter in the context of either a theoretical or practical situation, which he/she would like to answer or find a solution. Thus, the components of a research problem may be

summarized as:

- i. There should be an individual or a group who have some difficulty or problem.
- ii. There should be some objective(s) to be pursued. A person or an organization who wants nothing cannot have a problem.
- iii. There should be alternative means the course of action for obtaining the objective(s) the researcher wants to attain. This implies that there should be more than one alternative means available to the researcher. This is because if the researcher

has no choice of alternative means, he/she would not have a problem.

iv. There should be some doubt in the mind of the researcher about the choice of alternative means. This implies that research should answer the question relating to the relative efficiency or suitability of the possible alternatives.

v. There should be a context to which the difficulty relates.

Thus, a research problem is one which requires a researcher to find out the best solution for the given problem, i.e., to find out by which course of action the objective can be attained optimally in the context of a given environment. There are several factors which may result in making the problem complicated.

For instance, the environment may change affecting the efficiencies of the courses of action or the values of the outcomes; the number of alternative courses of action may be very large; persons not involved in making the decision may be affected by it and react to it favourably or unfavourably, and similar other factors. All such elements (or at least the important ones) may be thought of in context of a research problem.

1.9.1. Technique Involved in Defining a Problem

Defining a research problem properly and clearly is a crucial part of a research study and must in no case be accomplished hurriedly. However, in practice this a frequently overlooked which causes a lot of problems later on. Hence, the research problem should be defined in a systematic manner, giving due weightage to all relating points. The technique for the purpose involves the undertaking of the following steps generally one after the other:

- (i) Statement of the problem in a general way;
- (ii) Understanding the nature of the problem;
- (iii) Surveying the available literature
- (iv) Developing the ideas through discussions; and

(v) Rephrasing the research problem into a working proposition.

A brief description of all these points will be helpful.

(i) Statement of the problem in a general way: First of all the problem should be stated in a broad general way, keeping in view either some practical concern or some scientific or intellectual interest. For this purpose, the researcher must immerse himself thoroughly in the subject matter concerning which he wishes to pose a problem. In case of social research, it is considered advisable to do some field observation and as such the researcher may undertake some sort of preliminary survey or what is often called *pilot survey*. Then the researcher can himself state the problem or he can seek the guidance of the guide or the subject expert in accomplishing this task.

(ii) Understanding the nature of the problem: The next step in defining the problem is to understand its origin and nature clearly. The best way of understanding the problem is to discuss it with those who first raised it in order to find out how the problem originally came about and with what objectives in view. If the researcher has stated the problem himself, he should consider once again all those points that induced him to make a general statement concerning the problem. For a better understanding of the nature of the problem involved, he can enter into discussion with those who have a good knowledge of the problem concerned or similar other problems. The researcher should also keep in view the environment within which the problem is to be studied and understood.

(iii) Surveying the available literature: All available literature concerning the problem at hand must necessarily be surveyed and examined before a definition of the research problem is given. This means that the researcher must be well-conversant with relevant theories in the field, reports and records as also all other relevant literature. He must devote sufficient time in reviewing of research already undertaken on related problems. This is done to find out what data and other materials, if any, are available for operational purposes. "Knowing what data are available often serves to narrow the problem itself as well as the technique that might be used."

This would also help a researcher to know if there are certain gaps in the theories, or whether the existing theories applicable to the problem under study are in consistent with each other, or whether the findings of the different studies do not follow a pattern consistent with the theoretical expectations and so on.

Developing the ideas through (iv) discussions: Discussion concerning a problem often produces useful information. Various new ideas can be developed through such an exercise. Hence, a researcher must discuss his problem with his colleagues and others who have enough experience in the same area or in working on similar problems. This is quite often known as an experience survey. People with rich experience are in a position to enlighten the researcher on different aspects of his proposed study and their advice and comments are usually invaluable to the researcher. They help him sharpen his focus of attention on specific aspects within the field. Discussions with such persons should not only be confined to the formulation of the specific problem at hand, but should also be concerned with the general approach to the given problem, techniques that might be used, possible solutions, etc.

(v) **Rephrasing the research problem:** Finally, the researcher must sit to rephrase the research problem into a working proposition. Once the nature of the problem has been clearly understood, the environment (within which the

problem has got to be studied) has been defined, discussions over the problem have taken place and the available literature has been surveyed and examined, rephrasing the problem into analytical or operational terms is not a difficult task. Through rephrasing, the researcher puts the research problem in as specific terms as possible so that it may become operationally viable and may help in the development of working hypotheses.

1.10. Objectives of Research:

The objective of research is to find answers to the questions by applying scientific procedures. In other words, the main aim of research is to find out the truth which is hidden and has not yet been discovered. Although every research study has its own specific objectives, the research objectives may be broadly grouped as follows:

- To gain familiarity with new insights into a phenomenon (i.e.,exploratoryor formulative research studies);
- 2. To accurately portray the characteristics of a particular individual, group, or a situation (i.e., descriptive research studies);

- 3. To analyse the frequency with which something occurs (i.e., diagnostic research studies); and
- 4. To test a hypothesis of a causal relationship between two variables (such studies are known as hypothesis-testing research studies).

1.11. Hypothesis:

Hypothesis may be defined as "a proposition or a set of propositions set forth as an explanation for the occurrence of some specified group of phenomena either asserted merely as a provisional meet to guide some investigation in the light of established facts" (Kothari, 1988). A research hypothesis is quite often a predictive statement, which is capable of being tested using scientific methods that involve an independent and some dependent variables. For instance, the following statements may be considered:

i. "Students who take tuitions perform better than the others who do not receive tuitions" or,

ii. "The female students perform as well as the male students".

These two statements are hypotheses that can be objectively verified and tested. Thus, they indicate that a hypothesis states what one is looking for. Besides, it is a proposition that can be put to test in order to examine its validity.

1.11.1 Characteristics of Hypothesis:

A hypothesis should have the following characteristic features:-

- i. A hypothesis must be <u>precise and clear</u>. If it is not precise and clear, then the inferences drawn on its basis would not be reliable.
- ii. A hypothesis must be capable of being <u>put to test</u>. Quite often, the research programmes fail owing to its incapability of being subject to testing for validity.
- iii. A hypothesis must <u>state relationship between two variables</u>, in the case of relational hypotheses.
- iv. A hypothesis must be specific and limited in scope.
- v. As far as possible, a hypothesis must be <u>stated in the simplest</u> <u>language</u>, so as to make it understood by all concerned.
- vi. A hypothesis must be <u>consistent and derived from the most</u> <u>known facts</u>. In other words, it should be consistent with a substantial body of established facts. That is, it must be in the form of a statement which is most likely to occur.
- vii. A hypothesis must be <u>agreeable to testing</u> within a stipulated or reasonable period of time.

viii. A hypothesis should state the facts that give rise to the necessity of looking for an explanation. A hypothesis should explain what it actually wants to explain, and for this it should also have an <u>empirical reference.</u>

1.11.2. Concepts Relating to Testing of Hypotheses:

Testing of hypotheses requires a researcher to be familiar with various concepts concerned with it such as:

1) Null Hypothesis and Alternative Hypothesis:

In the context of statistical analysis, hypotheses are of two types viz., null hypothesis and alternative hypothesis. When two methods A and B are compared on their relative superiority, and it is assumed that both the methods are equally good, then such a statement is called as the null hypothesis. On the other hand, if method A is considered relatively superior to method B, or vice-versa, then such a statement is known as an alternative hypothesis. The null hypothesis is expressed as H0, while the alternative hypothesis is expressed as H1.

For example, if a researcher wants to test the hypothesis that the population mean (μ) is equal to the hypothesized mean (H0) = 100, then the null hypothesis should be stated

as the population mean is equal to the hypothesized mean 100. Symbolically it may be written as:-

H0: = μ = μ H0 = 100

If sample results do not support this null hypothesis, then it should be concluded that something else is true. The conclusion of rejecting the null hypothesis is called as alternative hypothesis H1. To put it in simple words, the set of alternatives to the null hypothesis is termed as the alternative hypothesis. If H0 is accepted, then it implies that Ha is being rejected. On the other hand, if H0 is rejected, it means that Ha is being accepted. For H0: $\mu = \mu$ H0 = 100, the following three possible alternative hypotheses may be considered:

Alternative hypothesis	To be read as follows
H1: $\mu \neq \mu$ H0	The alternative hypothesis is
	that the population mean is
	not equal to 100, i.e., it could
	be greater than or less than
	100
$H1: \mu > \mu H0$	The alternative hypothesis is
	that the population mean is
	greater than 100
$H1: \mu < \mu H0$	The alternative hypothesis is
	that the population mean is
	less than 100

Before the sample is drawn, the researcher has to state the null hypothesis and the alternative hypothesis. While formulating the null hypothesis, the following aspects need to be considered:

A. Alternative hypothesis is usually the one which a researcher wishes to prove, whereas the null hypothesis is the one which he/she wishes to disprove. Thus, a null hypothesis is usually the one which a researcher tries to reject, while an alternative hypothesis is the one that represents all other possibilities.

- B. The rejection of a hypothesis when it is actually true involves great risk, as it indicates that it is a null hypothesis because then the probability of rejecting it when it is true is α (i.e., the level of significance) which is chosen very small.
- C. Null hypothesis should always be specific hypothesis i.e., it should not state about or approximately a certain value.

2) The Level of Significance:

In the context of hypothesis testing, the level of significance is a very important concept. It is a certain percentage that should be chosen with great care, reason and insight. If for instance, the significance level is taken at 5 per cent, then it means that H0 would be rejected when the sampling result has a less than 0.05 probability of occurrence when H0 is true. In other words, the five per cent level of significance implies that the researcher is willing to take a risk of five per cent of rejecting the null hypothesis, when (H0) is actually true. In sum, the significance level reflects the maximum value of the probability of rejecting H0 when it is actually true, and which is usually determined prior to testing the hypothesis.

3) Test of Hypothesis or Decision Rule:

Suppose the given hypothesis is H0 and the alternative hypothesis H1, then the researcher has to make a rule known as the decision rule. According to the decision rule, the researcher accepts or rejects H0. For example, if the H0 is that certain students are good against the H1 that all the students are good, then the researcher should decide the number of items to be tested and the criteria on the basis of which to accept or reject the hypothesis.

4) Type I And Type II Errors:

As regards the testing of hypotheses, a researcher can make basically two types of errors. He/she may reject H0 when it is true, or accept H0 when it is not true. The former is called as Type I error and the latter is known as Type II error. In other words, Type I error implies the rejection of a hypothesis when it must have been accepted, while Type II error implies the acceptance of a hypothesis which must have been rejected. Type I error is denoted by α (alpha) and is known as α error, while Type II error is usually denoted by β (beta) and is known as β error.

5) One-Tailed and Two-Tailed Tests:

These two types of tests are very important in the context of hypothesis testing. A two-tailed test rejects the null hypothesis, when the sample mean is significantly greater or lower than the hypothesized value of the mean of the population. Such a test is suitable when the null hypothesis is some specified value; the alternative hypothesis is a value that is not equal to the specified value of the null hypothesis.

Procedure of Hypothesis Testing:

The procedure of hypothesis testing includes all the steps that a researcher undertakes for making a choice between the two alternative actions of rejecting or accepting a null hypothesis.

The various steps involved in hypothesis testing are as follows:

1) Making a Formal Statement:

This step involves making a formal statement of the null hypothesis (H0) and the alternative hypothesis (Ha). This implies that the hypotheses should be clearly stated within the purview of the research problem. For example, suppose a school teacher wants to test the understanding capacity of the students which must be rated more than 90 per cent in terms of marks, the hypotheses may be stated as follows:

Null Hypothesis H0: = 100 Alternative HypothesisH1 :> 100

2) Selecting a Significance Level:

The hypotheses should be tested on a pre-determined level of significance, which should be specified. Usually, either 5% level or 1% level is considered for the purpose. The factors that determine the levels of significance are:

(a) The magnitude of difference between the sample means;

(b) The sample size:

(c) The variability of measurements within samples; and

(d) Whether the hypothesis is directional or non-directional (Kothari, 1988).

In sum, the level of significance should be sufficient in the context of the nature and purpose of enquiry.

3) Deciding the Distribution to Use:

After making decision on the level of significance for hypothesis testing, the researcher has to next determine the appropriate sampling distribution. The choice to be made generally relates to normal distribution and the t-distribution. The rules governing the selection of the correct distribution are similar to the ones with respect to estimation.

4) Selection of a Random Sample and Computing an Appropriate Value:

Another step involved in hypothesis testing is the selection of a random sample and then computing a suitable value from the sample data relating to test statistic by using the appropriate distribution. In other words, it involves drawing a sample for furnishing empirical data.

5) Calculation of the Probability:

The next step for the researcher is to calculate the probability that the sample result would diverge as far as it can from expectations, under the situation when the null hypothesis is actually true.

6) Comparing the Probability:

Another step involved consists of making a comparison of the probability calculated with the specified value of α , i.e. the significance level. If the calculated probability works out to be equal to or smaller than the α value in case of one-tailed test, then the null hypothesis is to be rejected. On the other hand, if the calculated probability is greater, then the null hypothesis is

to be accepted. In case the null hypothesis H0 is rejected, the researcher runs the risk of committing the Type I error. But if the null hypothesis H0 is accepted, then it involves some risk (which cannot be specified in size as long as H0 is vague and not specific) of committing the Type II error.

1.12. Significance of Research in Commerce and Management:

According to a famous Hudson Maxim, "All progress is born of inquiry. Doubt is often better than overconfidence, for it leads to inquiry, and inquiry leads to invention". It brings out the significance of research, increased amount of which makes the progress possible.

- Research encourages scientific and inductive thinking, besides promoting the development of logical habits of thinking and organisation.
- 2. The role of research in applied economics in the context of an economy or business is greatly increasing in modern times.
- 3. The increasingly complex nature of government and business has raised the use of research in solving operational problems.

- 4. Research assumes significant role in the formulation of economic policy for both, the government and business.
- 5. It provides the basis for almost all government policies of an economic system. Government budget formulation, for example, depends particularly on the analysis of needs and desires of people, and the availability of revenues, which requires research.
- 6. Research helps to formulate alternative policies, in addition to examining the consequences of these alternatives.
- Research also facilitates the decision-making of policy-makers, although in it is not a part of research. In the process,
- 8. Research also helps in the proper allocation of a country's scarce resources.
- Research is also necessary for collecting information on the social and economic structure of an economy to understand the process of change occurring in the country.

10. research as a tool of government economic policy formulation involves three distinct stages of operation:

Research is equally important to social scientists for analyzing the social relationships and seeking explanations to various social problems. It gives intellectual satisfaction of knowing things for the sake of knowledge. It also possesses the practical utility for the social scientist to gain knowledge so as to be able to do something better or in a more efficient manner. The research in social sciences is concerned with both knowledge for its own sake, and knowledge for what it can contribute to solve practical problems.

Short Questions

- 1. Objectives of research
- 2. Qualities of a good research.
- 3. Social research.
- 4. Research methodology
- 5. Scope of research in business decision making.
- 6. What is statistical hypothesis
- 7. Research approaches
- 8. Importance of research

- 9. Need for research
- 10. Research problem

Essay Questions

- 1. What is Research Design? Write the methodology of a descriptive study.
- 2. Define hypothesis. Explain the procedure of testing hypotheses.
- 3. What is research explain where is types of research
- 4. What is research? Explain the difference between descriptive and experimental research.
- 5. What is a research problem? Discuss how a research problem is formulated.
- 6. Discuss the examples of exploratory research, descriptive and experimental research
- 7. What is research? Explain the research process in detail

Unit – II: Sources of Data and Sampling

2.1. Data Meaning

2.2. Types of Sources

2.2.1. Primary data
2.2.2Secondary data

2.3. Methods of Data Collection:

2.3.1. Questionnaire
2.3.2. Observation
2.3.3. Interview method
2.3.4. Schedule

2.4. Attitude Measurement Techniques:

2.5. Administration of Surveys

2.6. Sample Design and Sampling Techniques.

2.1. Data Meaning:

Information, especially facts or numbers, collected to be examined and considered and used to help decision-making, or information in an electronic form that can be stored and used by a computer:

2.2. Types of Sources:

The task of data collection begins after a research problem has been defined and research design/plan chalked out. It is important for a researcher to know the sources of data which he requires for different purposes. Data are nothing but the information. There are two sources of information or data they are

2.2.1. Primary data: The primary data which was collected afresh and for the first time, and thus happen to be original in character. The data are name after the source. Primary data refers to the data collected for the first time.

2.2.2. Secondary data: Secondary data refers to the data that have already been collected and used earlier by somebody or some agency and which have already been passed through the statistical process. The researcher would have to decide which sort of data he would be using (thus collecting) for his study and accordingly he will have to select one or the other method of data collection.

For example, the statistics collected by the Government of India relating to the population is primary data for the Government of India since it has been collected for the first time. Later when the same data are used by a researcher for his study of a particular problem, then the same data become the secondary data for the researcher.

2.3. Methods of Data Collection:

There are two major approaches to gathering information about a situation, person, problem or phenomenon. When you undertake a research study, in most situations, you need to collect the required information; however, sometimes the information required is already available and need only be extracted. Based upon these broad approaches to information gathering, data can be categorized as:

Primary Sources:

Primary data is one which is collected by the investigator himself/herself first time for the purpose of a specific inquiry or study. Such data is original in character and is generated by surveys conducted by individual or research institutions.

2.3.1. Questionnaire:

This method of data collection is quite popular, particularly in case of big enquiries. It is being adopted by private individuals, research workers, private and public organizations and even by governments. In this method a questionnaire is sent (usually by post) to the persons concerned with a request to answer the questions and return the questionnaire. A questionnaire consists of a number of questions printed or typed in a definite order on a form or set of forms. The questionnaire is mailed to respondents who are expected to read and understand the questions and write down the reply in the space meant for the purpose in the questionnaire itself. The respondents have to answer the questions on their own.

According to Bogardus, "A questionnaire is a list of questions sent to a number of persons for their answers and which obtains standardized results that can be tabulated and treated statistically".

The Dictionary of Statistical Terms defines it as a "Group of or sequence of questions designed to elicit information upon a subject or sequence of subjects from information."

A questionnaire should be designed or drafted with utmost care and caution so that all the relevant and essential information for the enquiry may be collected without any difficulty, ambiguity and vagueness. Drafting of a good questionnaire is a highly specialized job and requires great care skill, wisdom, efficiency and experience. No hard and fast rule can be laid down for designing or framing a questionnaire.

The mailed questionnaire: – The most common approach to collecting information is to send the questionnaire to prospective respondents by mail. Obviously this approach presupposes that you have access to their addresses. Usually it is a good idea to send a prepaid, self-addressed envelope with the questionnaire as this might increase the response rate. A mailed questionnaire *must* be accompanied by a covering letter (see below for details). One of the major problems with this method is the low response rate. In the case of an extremely low response rate, the findings have very limited applicability to the population studied.

* Collective administration:- One of the best ways of administering a questionnaire is to obtain a captive audience such as students in a classroom, people attending a function, participants in a programme or people assembled in one place. This ensures a very high response rate as you will find few people refuse to participate in your study. Also, as you have personal contact with the study population, you can explain the purpose, relevance and importance of the study and can clarify any questions that respondents may have. The author's advice is that if you have a captive audience for your study, don't miss the opportunity – it is the quickest way of collecting data, ensures a very high response rate and saves you money on postage.

The following general points designing or framing a questionnaire may be borne in mind:
1. Size of the Questionnaire should be small:

A researcher should try his best to keep the number of questions as small as possible, keeping in view the nature, objectives and scope of the enquiry. Respondent's time should not be wasted by asking irrelevant and unimportant questions. A large number of questions would involve more work for the investigator and thus result in delay on his part in collecting and submitting the information. A reasonable questionnaire should contain from 15 to 25 questions at large. If a still larger number of questions are a must in any enquiry, then the questionnaire should be divided into various sections or parts.

2. The questions should be clear:

The questions should be easy, brief, unambiguous, nonoffending, and courteous in tone, corroborative in nature and to the point, so that much scope of guessing is left on the part of the respondents.

3. The questions should be arranged in a logical sequence:

Logical arrangement of questions reduces lot of unnecessary work on the part of the researcher because it

not only facilitates the tabulation work but also does not leave any chance for omissions or commissions.

4. Questions should be simple to understand:

The vague words like good, bad, efficient, sufficient, prosperity, rarely, frequently, reasonable, poor, rich etc., should not be used since these may be interpreted differently by different persons and as such might give unreliable and misleading information. Similarly the use of words having double meaning like price, assets, capital income etc., should also be avoided.

5. Questions should be comprehensive & easily answerable:

Questions should be designed in such a way that they are readily comprehensible and easy to answer for the respondents. They should not be tedious nor should they tax the respondents' memory. At the same time questions involving mathematical calculations like percentages, ratios etc., should not be asked.

6. Questions of personal & sensitive nature should not be asked:

There are some questions which disturb the respondents and he/she may be shy or irritated by hearing such questions. Therefore, every effort should be made to avoid such questions. For example, 'do you cook yourself or your wife cooks?' 'Or do you drink?' Such questions will certainly irk the respondents and thus be avoided at any cost. If unavoidable then highest amount of politeness should be used.

7. Types of Questions:

Under this head, the questions in the questionnaire may be classified as follows:

(a) Shut Questions:

Shut questions are those where possible answers are suggested by the framers of the questionnaire and the respondent is required to tick one of them. Shut questions can further be subdivided into the following forms:

(i) Simple Alternate Questions:

In this type of questions the respondent has to choose from the two clear cut alternatives like 'Yes' or 'No', 'Right or Wrong' etc. Such questions are also called as dichotomous questions. This technique can be applied with elegance to situations where two clear cut alternatives exist.

(ii) Multiple Choice Questions:

Many a times it becomes difficult to define a clear cut alternative and accordingly in such a situation additional answers between Yes and No, like Do not know, No opinion, Occasionally, Casually, Seldom etc., are added. For example, in order to find if a person smokes or drinks, the following multiple choice answers may be used: Do you smoke?

- (a) Yes regularly [] (b) No never []
- (c) Occasionally [] (d) Seldom []

Multiple choice questions are very easy and convenient for the respondents to answer. Such questions save time and also facilitate tabulation. This method should be used if only a selected few alternative answers exist to a particular question.

8. Leading questions should be avoided:

Questions like 'why do you use a particular type of car, say Maruti Suzuki Dzire car' should preferably be framed into two questions(i) Which car do you use? (ii) W it?

(ii) Why do you prefer

It gives smooth ride []

- It gives more mileage []
- It is cheaper []

It is maintenance free []

9 Cross Checks:

The questionnaire should be so designed as to provide internal checks on the accuracy of the information supplied by the respondents by including some connected questions at least with respect to matters which are fundamental to the enquiry.

10 Pre Testing the Questionnaire:

It would be practical in every sense to try out the questionnaire on a small scale before using it for the given enquiry on a large scale. This has been found extremely useful in practice. The given questionnaire can be improved or modified in the light of the drawbacks, shortcomings and problems faced by the investigator in the pre test.

11 A Covering Letter:

A covering letter from the organizers of the enquiry should be enclosed along with the questionnaire for the purposes regarding definitions, units, concepts used in the questionnaire, for taking the respondent's confidence, selfaddressed envelope in case of mailed questionnaire, mention about award or incentives for the quick response, a promise to send a copy of the survey report etc.

2.3.2. Observation: The observation method is the most commonly used method especially in studies relating to behavioral sciences. This method implies the collection of information by way of investigator's own observation, without interviewing the respondents. The information obtained relates to what is currently happening and is not complicated by either the past behavior or future intentions or attitudes of respondents. This method is no doubt an expensive method and the information provided by this method is also very limited. As such this method is not suitable in inquiries where large samples are concerned.

Observation is one way to collect primary data. Observation is a purposeful, systematic and selective way of watching and listening to an interaction or phenomenon as it

67

takes place. There are many situations in which observation is the most appropriate method of data collection; for example, when you want to learn about the interaction in a group, study the dietary patterns of a population, ascertain the functions performed by a worker, or study the behavior or personality traits of an individual. It is also appropriate in situations where full and/or accurate information cannot be elicited by questioning, because respondents either are not co-operative or are unaware of the answers because it is difficult for them to detach themselves from the interaction. In summary, when you are more interested in the behavior than in the perceptions of individuals, or when subjects are so involved in the interaction that

They are unable to provide objective information about it, observation is the best approach to collect the required information.

Types of observation

There are two types of observation:

- 1. Participant Observation;
- 2. Non-Participant Observation.

1. Participant Observation is when you, as a researcher, participate in the activities of the group being observed in the same manner as its members, with or without their knowing that they are being observed.

For example, you might want to examine the reactions of the general population towards people in wheelchairs. You can study their reactions by sitting in a wheelchair yourself. Or you might want to study the life of prisoners and pretend to be a prisoner in order to do this.

2. Non-participant observation, on the other hand, is when you, as a researcher, do not get involved in the activities of the group but remain a passive observer, watching and listening to its activities and drawing conclusions from this.

For example, you might want to study the functions carried out by nurses in a hospital. As an observer, you could watch, follow and record the activities as they are performed. After making a number of observations, conclusions could be drawn about the functions nurses carry out in the hospital. Any occupational group in any setting can be observed in the same manner. **2.3.3. Interview Method:** The interview method of collecting data involves presentation of oral-verbal stimuli and reply interns of oral-verbal responses. This method can be used through personal interviews and, if possible, through telephone interviews.

(a) **Personal interviews:** Personal interview method requires a person known as the interviewer asking questions generally in a face-to-face contact to the other person or persons. (At times the interviewee may also ask certain questions and the interviewer responds to these, but usually the interviewer initiates the interview and collects the information.) This sort of interview may be in the form of direct personal investigation or it may be indirect oral investigation. In the case of direct personal investigation the interviewer has to collect the information personally from the sources concerned. He has to be on the spot and has to meet people from whom data have to be collected.

This method is particularly suitable for intensive investigations. But in certain cases it may not be possible or worthwhile to contact directly the persons concerned or on account of the extensive scope of enquiry, the direct personal investigation technique may not be used. In such cases an indirect oral examination can be conducted under which the interviewer has to cross-examine other persons who are supposed to have knowledge about the problem under investigation and the information, obtained is recorded. Most of the commissions and committees appointed by government to carry on investigations make use of this method.

The method of collecting information through personal interviews is usually carried out in structured way.

As such we call the interviews as *structured interviews*. Such interviews involve the use of a set of predetermined questions and of highly standardized techniques of recording. Thus, the interviewer in a structured interview follows a rigid procedure laid down, asking questions in a form and order prescribed. As against it, the **unstructured interviews**are characterized by a flexibility of approach to questioning.

Unstructured interviews do not follow a system of predetermined questions and standardized techniques of recording information. In a non-structured interview, the interviewer is allowed much greater freedom to ask, in case of need, supplementary questions or at times he may omit certain questions if the situation so requires. He may even change the sequence of questions. He has relatively greater freedom while recording the responses to include some aspects and exclude others. But this sort of flexibility results in lack of comparability of one interview with another and the analysis of unstructured responses becomes much more difficult and time-consuming than that of the structured responses obtained in case of structured interviews.

Unstructured interviews also demand deep knowledge and greater skill on the part of the interviewer. Unstructured interview, however, happens to be the central technique of collecting information in case of exploratory or formulate research studies. But in case of descriptive studies, we quite often use the technique of structured interview because of its being more economical, providing a safe basis for generalization and requiring relatively lesser skill on the part of the interviewer. We may as well talk about focused interview, clinical interview and the non-directive interview.

Focused interview: is meant to focus attention on the given experience of the respondent and its effects. Under it the interviewer has the freedom to decide the manner and sequence in which the questions would be asked and has also the freedom to explore reasons and motives. The main task of the interviewer in case of a focused interview is to confine the respondent to a discussion of issues with which he seeks conversance. Such interviews are used generally in the development of hypotheses and constitute a major type of unstructured interviews.

The **clinical interview** is concerned with broad underlying feelings or motivations or with the course of individual's life experience. The method of eliciting information under it is generally left to the interviewer's discretion. In case of **non-directive interview**, the interviewer's function is simply to encourage the respondent to talk about the given topic with a bare minimum of direct questioning.

The interviewer often acts as a catalyst to a comprehensive expression of the respondents' feelings and beliefs and of the frame of reference within which such feelings and beliefs take on personal significance.

Despite the variations in interview-techniques, the major advantages and weaknesses of personal interviews can be enumerated in a general way.

(A) **Merits of the interview method:** The chief merits of the interview method are as follows:

(i) More information and that too in greater depth can be obtained.

(ii) Interviewer by his own skill can overcome the resistance, if any, of the respondents; the interview method can be made to yield an almost perfect sample of the general population.

(iii) There is greater flexibility under this method as the opportunity to restructure questions is always there, specially in case of unstructured interviews.

(iv) Observation method can as well be applied to recording verbal answers to various questions.

(v) Personal information can as well be obtained easily under this method.

74

(vi) Samples can be controlled more effectively as there arises no difficulty of the missing returns; non-response generally remains very low.

(vii) The interviewer can usually control which person(s) will answer the questions. This is not possible in mailed questionnaire approach. If so desired, group discussions may also be held.

(viii) The interviewer may catch the informant off-guard and thus may secure the most spontaneous reactions than would be the case if mailed questionnaire is used.

(ix) The language of the interview can be adapted to the ability or educational level of the person interviewed and as such misinterpretations concerning questions can be avoided.

(x) The interviewer can collect supplementary information about the respondent's personal characteristics and environment which is often of great value in interpreting results.

(B) Weaknesses of the interview method: But there are also certain weaknesses of the interview method. Among the important weaknesses, mention may be made of the following: (i) It is a very expensive method, specially when large and widely spread geographical sample is taken.

(ii) There remains the possibility of the bias of interviewer as well as that of the respondent; there also remains the headache of supervision and control of interviewers.

(iii) Certain types of respondents such as important officials or executives or people in high-income groups may not be easily approachable under this method and to that extent thedata may prove inadequate.

(iv) This method is relatively more-time-consuming, specially when the sample is large and recalls upon the respondents are necessary.

(v) The presence of the interviewer on the spot may overstimulate the respondent, sometimes even to the extent that he may give imaginary information just to make the interview interesting.

(vi) Under the interview method the organization required for selecting, training and supervising the field-staff is more complex with formidable problems.

(vii) Interviewing at times may also introduce systematic errors.

(viii) Effective interview presupposes proper rapport with respondents that would facilitate free and frank responses.This is often a very difficult requirement.

Pre-requisites and basic tenets of interviewing: For successful implementation of the interview method, interviewers should be carefully selected, trained and briefed. They should be honest, sincere, hardworking, and impartial and must possess the technical competence and necessary practical experience.

Telephone interviews:This method of collecting information consists in contacting respondents on telephone itself. It is not a very widely used method, but plays important part in industrial surveys, particularly in developed regions.

Merits of Telephone interviews: The main merits of such a system are:

1. It is more flexible in comparison to mailing method.

2. It is faster than other methods i.e., a quick way of obtaining information.

3. It is cheaper than personal interviewing method; here the cost per response is relatively low.

4. Recall is easy; callbacks are simple and economical.

5. There is a higher rate of response than what we have in mailing method; the non-response is generally very low.

6. Replies can be recorded without causing embarrassment to respondents.

7. Interviewer can explain requirements more easily.

8. At times, access can be gained to respondents who otherwise cannot be contacted for one reason or the other.

9. No field staff is required.

10. Representative and wider distribution of sample is possible.

Demerits of Telephone interviews: But this system of collecting information is not free from demerits. Some of these may be highlighted.

1. Little time is given to respondents for considered answers; interview period is not likely to exceed five minutes in most cases.

2. Surveys are restricted to respondents who have telephone facilities.

3. Extensive geographical coverage may get restricted by cost considerations.

78

4. It is not suitable for intensive surveys where comprehensive answers are required to various questions.

5. Possibility of the bias of the interviewer is relatively more.

6. Questions have to be short and to the point; probes are difficult to handle.

2.3.4. Collection of Data through Schedules

This method of data collection is very much like the collection of data through questionnaire, with little difference which lies in the fact that schedules (proforma containing a set of questions) are being filled in by the enumerators who are specially appointed for the purpose.

This method requires the selection of enumerators for filling up schedules or assisting respondents to fill up schedules and as such enumerators should be very carefully selected. The enumerators should be trained to perform their job well and the nature and scope of the investigation should be explained to them thoroughly so that they may well understand the implications of different questions put in the schedule.

This method of data collection is very useful in extensive enquiries and can lead to fairly reliable results. It is, however, very expensive and is usually adopted in investigations conducted by governmental agencies or by some big organizations. Population census all over the world is conducted through this method.

Distinction (or) Difference between Questionnaires and Schedules:

S.No.	Points of Difference	Questionnaire	Schedule	
1	Nature of Data	Indirect method	Direct Method i.e., Researcher	
	Collection	(Impersonal) sent through	himself / herself	
		mail	Collection the schedule	
2	Cost	Relatively cheap as it	More expensive as it money	
		money only preparation of	not only preparation of	
		questionnaire and mailing	schedule but also appoint of	
		the same	enumerators	
3	Non-response	High	Low	
4	Target Respondent	Clearly known	Clearly not known	
5	Time	very slow	Speed (well in time)	
6	Personal Contact	Not Possible	Possible	
7	Applicability	Literate	Illiterate	
8	Scope	Wider	Narrow	
9	Risk of Collecting	More	Very less	
	Incomplete Data			
10	Success	Depends on quality of	Depends on honesty and	
		questionnaire itself	competence of enumerators	
11	Appearance (physical)	Attractive should be	Not necessary	
	of questionnaire			

12	Combination	of	No Combination possible	Observation	method	also
	methods			possible	along	with
				questionnaires		

2.4. Measurement in Research:

In our daily life we are said to measure when we use some yardstick to determine weight, height, or some other feature of a physical object. We also measure when we judge how well we like a song, a painting or the personalities of our friends. We, thus, measure physical objects as well as abstract concepts. Measurement is a relatively complex and demanding task, specially so when it concerns qualitative or abstract phenomena. By measurement we mean the process of assigning numbers to objects or observations, the level of measurement being a function of the rules under which the numbers are assigned.

It is easy to assign numbers in respect of properties of some objects, but it is relatively difficult in respect of others. .

Technically speaking, measurement is a process of mapping aspects of a domain onto other aspects of a range according to some rule of correspondence. In measuring, we devise some form of scale in the range (in terms of set theory, range may refer to some set) and then transform or map the properties of objects from the domain (in terms of set theory, domain may refer to some other set) onto this scale.

For example, in case we are to find the male to female attendance ratio while conducting a study of persons who attend some show, then we may tabulate those who come to the show according to sex. In terms of set theory, this process is one of mapping the observed physical properties of those coming to the show (the domain) on to a sex classification (the range). The rule of correspondence is: If the object in the domain appears to be male, assign to "0" and if female assign to "1".

Similarly, we can record a person's marital status as 1, 2, 3 or 4, depending on whether the person is single, married, widowed or divorced. We can as well record "Yes or No" answers to a question as "0" and "1" (or as 1 and 2 or perhaps as 59 and 60). In this artificial or nominal way, categorical data (qualitative or descriptive) can be made into numerical data and if we thus code the various categories, we refer to the numbers we record as nominal data. *Nominal data* are numerical in name only, because they do not share any of the properties of the numbers we deal in ordinary arithmetic. For instance if we record marital status as 1, 2, 3, or 4 as stated above, we cannot write 4 > 2 or 3 < 4 and we cannot write 3 - 1 = 4 - 2, 1 + 3 = 4 or 4 , 2 = 2. In those situations when we cannot do anything except set up inequalities, we refer to the data as ordinal data.

2.4.1 Measurement Scales:

From what has been stated above, we can write that scales of measurement can be considered in terms of their mathematical properties.

The most widely used classification of measurement scales are:

- (a) Nominal scale
- (b) Ordinal scale
- (c) Interval scale and
- (d) Ratio scale.

(a) Nominal scale: Nominal scale is simply a system of assigning number symbols to events in order to label them. The usual example of this is the assignment of numbers of basketball players in order to identify them. Such numbers cannot be considered to be associated with an ordered scale for their order is of no consequence; the numbers are just convenient labels for the particular class of events and as

such have no quantitative value. Nominal scales provide convenient ways of keeping track of people, objects and events. One cannot do much with the numbers involved.

For example, one cannot usefully average the numbers on the back of a group of football players and come up with a meaningful value. Neither can one usefully compare the numbers assigned to one group with the numbers assigned to another. The counting of members in each group is the only possible arithmetic operation when a nominal scale is employed. Accordingly, we are restricted to use mode as the measure of central tendency. There is no generally used measure of dispersion for nominal scales.

Chi-square test is the most common test of statistical significance that can be utilized, and for the measures of correlation, the contingency coefficient can be worked out. Nominal scale is the least powerful level of measurement. It indicates no order or distance relationship and has no arithmetic origin. A nominal scale simply describes differences between things by assigning them to categories. Nominal data are, thus, counted data. The scale wastes any information that we may have about varying degrees of attitude, skills, understandings, etc. In spite of all this, nominal scales are still very useful and are widely used in surveys and other *ex-post-facto* research when data are being classified by major sub-groups of the population.

(b) Ordinal scale: The lowest level of the ordered scale that is commonly used is the ordinal scale. The ordinal scale places events in order, but there is no attempt to make the intervals of the scale equal in terms of some rule. Rank orders represent ordinal scales and are frequently used in research relating to qualitative phenomena. A student's rank in his graduation class involves the use of an ordinal scale. One has to be very careful in making statement about scores based on ordinal scales. For instance, if Ram's position in his class is 10 and Mohan's position is 40, it cannot be said that Ram's position is four times as good as that of Mohan. The statement would make no sense at all.

Ordinal scales only permit the ranking of items from highest to lowest. Ordinal measures have no absolute values, and the real differences between adjacent ranks may not be equal. All that can be said is that one person is higher or lower on the scale than another, but more precise comparisons cannot be made. Thus, the use of an ordinal scale implies a statement of 'greater than' or 'less than' (an equality statement is also acceptable) without our being able to state how much greater or less.

The real difference between ranks 1 and 2 may be more or less than the difference between ranks 5 and 6. Since the numbers of this scale have only a rank meaning, the appropriate measure of central tendency is the median. A percentile or quartile measure is used for measuring dispersion. Correlations are restricted to various rank order methods. Measures of statistical significance are restricted to the non-parametric methods.

(c) Interval scale: In the case of interval scale, the intervals are adjusted in terms of some rule that has been established as a basis for making the units equal. The units are equal only in so far as one accepts the assumptions on which the rule is based. Interval scales can have an arbitrary zero, but it is not possible to determine for them what may be called an absolute zero or the unique origin.

The primary limitation of the interval scale is the lack of a true zero; it does not have the capacity to measure the

complete absence of a trait or characteristic. The

Fahrenheit scale is an example of an interval scale and shows similarities in what one can and cannot do with it. One can say that an increase in temperature from 30° to 40° involves the same increase in temperature as an increase from 60° to 70° , but one cannot say that the temperature of 60° is twice as warm as the temperature of 30° because both numbers are dependent on the fact that the zero on the scale is set arbitrarily at the temperature of the freezing point of water.

The ratio of the two temperatures, 30° and 60°, means nothing because zero is an arbitrary point. Interval scales provide more powerful measurement than ordinal scales for interval scale also incorporates the concept of equality of interval. As such more powerful statistical measures can be used with interval scales. Mean is the appropriate measure of central tendency, while standard deviation is the most widely used measure of dispersion. Product moment correlation techniques are appropriate and the generally used tests for statistical significance are the't' test and 'F' test. (d) Ratio scale: Ratio scales have an absolute or true zero of measurement. The term 'absolute zero' is not as precise as it was once believed to be. We can conceive of an absolute zero of length and similarly we can conceive of an absolute zero of time. For example, the zero point on a centimeter scale indicates the complete absence of length or height. But an absolute zero of temperature is theoretically unobtainable and it remains a concept existing only in the scientist's mind.

The number of minor traffic-rule violations and the number of incorrect letters in a page of type script represent scores on ratio scales. Both these scales have absolute zeros and as such all minor traffic violations and all typing errors can be assumed to be equal in significance. With ratio scales involved one can make statements like "Jyoti's" typing performance was twice as good as that of "Reetu."

The ratio involved does have significance and facilitates a kind of comparison which is not possible in case of an interval scale. Ratio scale represents the actual amounts of variables. Measures of physical dimensions such as weight, height, distance, etc. are examples. Generally, all statistical techniques are usable with ratio scales and all manipulations that one can carry out with real numbers can also be carried out with ratio scale values. Multiplication and division can be used with this scale but not with other scales mentioned above.

Geometric and harmonic means can be used as measures of central tendency and coefficients of variation may also be calculated. Thus, proceeding from the nominal scale (the least precise type of scale) to ratio scale (the most precise), relevant information is obtained increasingly. If the nature of the variables permits, the researcher should use the scale that provides the most precise description. Researchers in physical sciences have the advantage to describe variables in ratio scale form but the behavioral sciences are generally limited to describe variables in interval scale form, a less precise type of measurement.

2.4.2. Comparison of nominal scale, ordinal scale, interval scale and ratio scale.

Scale	Basic characteristics	Common examples	Marketing examples		
Nominal	Numbers identity and	Social security nos.,	Brand nos.,		
	classify objects	numbering of football	Store types		
		players			
Ordinal	Numbers indicate the	Quality rankings,	Preference Rankings,		
	relative positions of	rankings of teams in a	Market position,		
	objects but not the	tournament	Social class		
	magnitude of differences				
	between them				
Interval	differences between	Temperature	Attitudes,		
	objects can be compared,	(Fahrenheit)	Opinions,		
	zero point is arbitrary	(Celsius)	Index numbers		
Ratio	Zero point is fixed, ratios	Length,	Age, Sales, Income,		
	of scale values can be	Weight.	costs.		
	compared				

2.4.3. Scale construction techniques:Following are the five main techniques by which scales can be developed.

(i) Arbitrary approach: It is an approach where scale is developed on ad hoc basis. This is the most widely used approach. It is presumed that such scales measure the concepts for which they have been designed, although there is little evidence to support such an assumption.

(ii) Consensus approach: Here a panel of judges evaluate the items chosen for inclusion in the instrument in terms of whether they are relevant to the topic area and unambiguous in implication.

(iii) Item analysis approach:Under it a number of individual items are developed into a test which is given to a group of respondents. After administering the test, the total scores are calculated for everyone. Individual items are then analyzed to determine which items discriminate between persons or objects with high total scores and those with low scores.

(iv) Cumulative scales approach: are chosen on the basis of their conforming to some ranking of items with ascending and descending discriminating power. For instance, in such a scale the endorsement of an item representing an extreme position should also result in the endorsement of all items indicating a less extreme position.

(vi) Factor scales approach: may be constructed on the basis of inter correlations of items which indicate that a common factor accounts for the relationship between items. This relationship is typically measured through factor analysis method.

2.5. Administration of survey:

2.5.1. Differential Scales (or Thurstone-type Scales)

The name of L.L. Thurstone is associated with differential scales which have been developed using consensus scale approach. Under this approach the selection of items is made by a panel of judges who evaluate the items in terms of whether they are relevant to the topic area and unambiguous in implication.

The detailed procedure is as under:

(a) The researcher gathers a large number of statements, usually twenty or more, that express various points of view toward a group, institution, idea, or practice (i.e., statements belonging to the topic area).

(b) These statements are then submitted to a panel of judges, each of whom arranges them in eleven groups or piles ranging from one extreme to another in position. Each of the judges is requested to place generally in the first pile the statements which he thinks are most unfavourable to the issue, in the second pile to place those statements which he thinks are next most unfavourable and he goes on doing so in this manner till in the eleventh pile he puts the statements which he considers to be the most favourable. (c) This sorting by each judge yields a composite position for each of the items. In case of marked disagreement between the judges in assigning a position to an item, that item is discarded.

(d) For items that are retained, each is given its median scale value between one and eleven as established by the panel. In other words, the scale value of any one statement is computed as the 'median' position to which it is assigned by the group of judges.

(e) A final selection of statements is then made. For this purpose a sample of statements, whose median scores are spread evenly from one extreme to the other is taken. The statements so selected, constitute the final scale to be administered to respondents. The position of each statement on the scale is the same as determined by the judges.

After developing the scale as stated above, the respondents are asked during the administration of the scale to check the statements with which they agree. The median value of the statements that they check is worked out and this establishes their score or quantifies their opinion. It may be noted that in the actual instrument the statements are arranged in random order of scale value. If the values are valid and if the opinionnaire deals with only one attitude dimension, the typical respondent will choose one or several contiguous items (in terms of scale values) to reflect his views. However, at times divergence may occur when a statement appears to tap a different attitude dimension.

Merits of Thurstone Method:

- This method has been widely used for developing differential scales which are utilized to measure attitudes towards varied issues like war, religion, etc.
- Such scales are considered most appropriate and reliable when used for measuring a single attitude.

Demerits of Thurstone Method:

- \succ To their use is the cost and effort required to develop them.
- Another weakness of such scales is that the values assigned to various statements by the judges may reflect their own attitudes.
- The method is not completely objective; it involves ultimately subjective decision process.

2.5.2. Summated Scales (or Likert-type Scales) or Likert- 5 point scale:

Summated scales (or Likert-type scales) are developed by utilizing the item analysis approach wherein a particular item is evaluated on the basis of how well it discriminates between those persons whose total score is high and those whose score is low. Those items or statements that best meet this sort of discrimination test are included in the final instrument.

Thus, summated scales consist of a number of statements which express either a favourable or unfavourable attitude towards the given object to which the respondent is asked to react. The respondent indicates his agreement or disagreement with each statement in the instrument. Each response is given a numerical score, indicating its favourableness or unfavourableness, and the scores are totaled to measure the respondent's attitude. In other words, the overall score represents the respondent's position on the continuum of favourable-unfavourableness towards an issue.

Most frequently used summated scales in the study of social attitudes follow the pattern devised by Likert. For this reason they are often referred to as Likert-type scales. In a Likert scale, the respondent is asked to respond to each of the statements in terms of several degrees, usually five degrees (but at times 3 or 7 may also be used) of agreement or disagreement. For example, when asked to express opinion whether one considers his job quite pleasant, the respondent may respond in any one of the following ways:

- (i) strongly agree 5
- (ii) agree 4
- (iii) Undecided 3
- (iv) Disagree 2
- (v) Strongly disagree 1

We find that these five points constitute the scale. At one extreme of the scale there is strong agreement with the given statement and at the other, strong disagreement, and between them lie intermediate points. We may illustrate this as under: Each point on the scale carries a score. Response indicating the least favourable degree of job satisfaction is given the least score (say 1) and the most favourable is given the highest score (say 5). These score—values are normally not printed on the instrument but are shown here just to indicate the scoring pattern. The Likert scaling technique, thus, assigns a scale value to each of the five responses. The same thing is done in respect of each and every statement in the instrument. This way the instrument yields a total score for each respondent, which would then measure the respondent's favourableness toward the given point of view. If the instrument consists of, say 30 statements, the following score values would be revealing.

 $30 \times 5 = 150$ Most favourable response possible,

 $30 \times 4 = 120$ favorable response

 $30 \times 3 = 90$ A neutral attitude

 $30 \times 2 = 60$ unfavourableattitude

 $30 \times 1 = 30$ Most unfavourable attitude.

The scores for any individual would fall between 30 and 150. If the score happens to be above 90, it shows favourable opinion to the given point of view, a score of below 90 would mean unfavourable opinion and a score of exactly 90 would be suggestive of a neutral attitude.

Procedure:The procedure for developing a Likert-type scale is as follows:
(i) As a first step, the researcher collects a large number of statements which are relevant to the attitude being studied and each of the statements expresses definite favourableness or unfavourableness to a particular point of view or the attitude and that the number of favourable and unfavourable statements is approximately equal.

(ii) After the statements have been gathered, a trial test should be administered to a number of subjects. In other words, a small group of people, from those who are going to be studied finally, are asked to indicate their response to each statement by checking one of the categories of agreement or disagreement using a five point scale as stated above.

(iii) The response to various statements are scored in such a way that a response indicative of the most favourable attitude is given the highest score of 5 and that with the most unfavourable attitude is given the lowest score, say, of 1.

(iv) Then the total score of each respondent is obtained by adding his scores that he received for separate statements.

(v) The next step is to array these total scores and find out those statements which have a high discriminatory power. For this purpose, the researcher may select some part of the highest and the lowest total scores, say the top 25 per cent and the bottom 25 per cent. These two extreme groups are interpreted to represent the most favourable and the least favourable attitudes and are used as criterion groups by which to evaluate individual statements. This Stronglyagree (1)Agree(2)Undecided(3)Disagree(4)Stronglydisagree (5) way we determine which statements consistently correlate with low favourability and which with high favourability.

(vi) Only those statements that correlate with the total test should be retained in the final instrument and all others must be discarded from it.

Advantages: The Likert-type scale has several advantages. Mention may be made of the important ones.

(a) It is relatively easy to construct the Likert-type scale in comparison to Thurstone-type scale because Likert-type scale can be performed without a panel of judges.

(b) Likert-type scale is considered more reliable because under it respondents answer each statement included in the instrument. As such it also provides more information and data than does the Thurstone-type scale.

(c) Each statement, included in the Likert-type scale, is given an empirical test for discriminating ability and as such, unlike Thurstone-type scale, the Likert-type scale permits the use of statements that are not manifestly related (to have a direct relationship) to the attitude being studied.

(d) Likert-type scale can easily be used in respondentcentred and stimulus-centred studies

i.e., through it we can study how responses differ between people and how responses differ between stimuli.

(e) Likert-type scale takes much less time to construct, it is frequently used by the students of opinion research. Moreover, it has been reported in various research studies* that there is high degree of correlation between Likert-type scale and Thurstone-type scale.

Limitations:There are several limitations of the Likert-type scale as well.

Likert- 5 point scale, we can simply examine whether respondents are more or less favourable to a topic, but we cannot tell how much more or less they are.

- There is no basis for belief that the five positions indicated on the scale are equally spaced. The interval between 'strongly agree' and 'agree', may not be equal to the interval between "agree" and "undecided". This means that Likert scale does not rise to a stature more than that of an ordinal scale, whereas the designers of Thurstone scale claim the Thurstone scale to be an interval scale.
- One further disadvantage is that often the total score of an individual respondent has little clear meaning since a given total score can be secured by a variety of answer patterns.
- It is unlikely that the respondent can validly react to a short statement on a printed form in the absence of real-life qualifying situations.
- Moreover, there "remains a possibility that people may answer according to what they think they should feel rather than how they do feel."

2.6. Sample Design:

A sample design is a definite plan for obtaining a sample from a given population. It refers to the technique or the 101 procedure the researcher would adopt in selecting items for the sample. Sample design may as well lay down the number of items to be included in the sample i.e., the size of the sample. Sample design is determined before data are collected. Researcher must select/prepare a sample design which should be reliable and appropriate for his research study.

Steps in Sample Design:

While developing a sampling design, the researcher must pay attention to the following points:

(i) **Type of universe:** The first step in developing any sample design is to clearly define the set of objects, technically called the Universe, to be studied. The universe can be finite or infinite. In finite universe the number of items is certain, but in case of an infinite universe the number of items is infinite, i.e., we cannot have any idea about the total number of items. The population of a city, the number of workers in a factory and the like are examples of finite universes, whereas the number of stars in the sky, listeners of a specific radio programme, throwing of a dice etc. are examples of infinite universes.

(ii) **Sampling unit:** A decision has to be taken concerning a sampling unit before selecting sample. Sampling unit may be a

geographical one such as state, district, village, etc., or a construction unit such as house, flat, etc., or it may be a social unit such as family, club, school, etc., or it may be an individual. The researcher will have to decide one or more of such units that he has to select for his study.

(iii) **Source list:** It is also known as 'sampling frame' from which sample is to be drawn. It contains the names of all items of a universe (in case of finite universe only). If source list is not available, researcher has to prepare it. Such a list should be comprehensive, correct, reliable and appropriate. It is extremely important for the source list to be as representative of the population as possible.

(iv) **Size of sample:** This refers to the number of items to be selected from the universe to constitute a sample. This is a major problem before a researcher. The size of sample should neither be excessively large, nor too small. It should be optimum. An optimum sample is one which fulfills the requirements of efficiency, representativeness, reliability and flexibility. While deciding the size of sample, researcher must determine the desired precision as also an acceptable confidence level for the estimate. The size of population variance needs tobe considered

as in case of larger variance usually a bigger sample is needed. The size of population must be kept in view for this also limits the sample size. The parameters of interest in a research study must be kept in view, while deciding the size of the sample. Costs to dictate the size of sample that we can draw. As such, budgetary constraint must invariably be taken into consideration when we decide the sample size.

(v) **Parameters of interest:** In determining the sample design, one must consider the question of the specific population parameters which are of interest. For instance, we may be interested in estimating the proportion of persons with some characteristic in the population, or we may be interested in knowing some average or the other measure concerning then population. There may also be important sub-groups in the population about whom we would like to make estimates. All this has a strong impact upon the sample design we would accept.

(vi) **Budgetary constraint:** Cost considerations, from practical point of view, have a major impact upon decisions relating to not only the size of the sample but also to the type of sample. This fact can even lead to the use of a non-probability sample.

(vii) **Sampling procedure:** Finally, the researcher must decide the type of sample he will use

i.e., he must decide about the technique to be used in selecting the items for the sample. Infarct, this technique or procedure stands for the sample design itself. There are several sample designs (explained in the pages that follow) out of which the researcher must choose one for his study. Obviously, he must select that design which, for a given sample size and for a given cost, has a smaller sampling error.

Different Types of Sample Designs:

The following chart exhibits the sample designs as explained above. Thus, sample designs are basically of three types viz.

1) Probability sampling,

- 2) Non-Probability sampling and
- 3) Mixed Sampling

Probability Sampling:

Probability sampling is also known as 'choice sampling' or 'random sampling'. Under this sampling design, every item of the universe has an equal chance of being included in the sample. In a way, it is a lottery method under which individual units are selected from the whole group, not deliberately, but by using some mechanical process. Therefore, only chance would determine whether an item or the other would be included in the sample or not. The results obtained from probability or random sampling would be assured in terms of probability. That is, the researcher can measure the errors of estimation or the significance of results obtained from the random sample. This is the superiority of random sampling design over the deliberate sampling design.

Random sampling satisfies the law of statistical regularity, according to which if on an average the sample chosen is random, then it would have the same composition and characteristics of the universe.

This is the reason why the random sampling method is considered the best technique of choosing a representative sample.The following are the implications of the random sampling:

- it provides each element in the population an equal probable chance of being chosen in the sample, with all choices being independent of one another and
- ➢ It offers each possible sample combination an equal probable opportunity of being selected.

Simple Random Sampling (SRS) :- The most commonly used method of selecting a probability sample. In line with the definition of randomization, whereby each element in the population is given an equal and independent chance of selection, let us take example of the class. There are 80 students in the class, and so the first step is to identify each student by a number from 1 to 80. Suppose you decide to select a sample of 20 using the simple random sampling technique. Use the fishbowl draw, the table for random numbers or a computer program to select the 20 students. These 20 students become the basis of your enquiry.

Method of Selecting a Random Sample:

The process of selecting a random sample involves writing the name of each element of a finite population on a slip of paper and putting them into a box or a bag. Then they have to be thoroughly mixed and then the required number of slips for the sample can be picked one after the other without replacement. While doing this, it has to be ensured that in successive drawings each of the remaining elements of the population has an equal chance of being chosen. This method results in the same probability for each possible sample

Stratified random sampling: – As discussed, the accuracy of your estimate largely depends on the extent of variability or heterogeneity of the study population with respect to the

characteristics that have a strong correlation with what you are trying to It follows; therefore, that if the heterogeneity in the population can be reduced by some means for a given sample size you can achieve greater accuracy in your estimate. Stratified random sampling is based upon this logic.

In stratified random sampling the researcher attempts to stratify the population in such a way that the population within a stratum is homogeneous with respect to the characteristic on the basis of which it is being stratified. It is important that the characteristics chosen as the basis of stratification are clearly identifiable in the study population. For example, it is much easier to stratify a population on the basis of gender than on the basis of age, income or attitude. It is also important for the characteristic that becomes the basis of stratification to be related to the main variable that you are exploring.

Once the sampling population has been separated into no overlapping groups, you select the required number of elements from each stratum, using the simple random sampling technique. There are two types of stratified sampling:

Proportionate Stratified Sampling:-With proportionate stratified sampling, the number of elements from each stratum in

relation to its proportion in the total population is selected, For example, if the final year MBA students of the management faculty of a university consist of the following specialization groups:

Specialization Stream	No. of Students	Proportion of each stream.
Production	40	0.4
Finance	20	0.2
Marketing	30	0.3
Rural Development	10	0.1
Total	100	1.0

The researcher wants to draw an overall sample of 30, then the strata sample sizes would be:

Strata	Sample Size
Production	30 x 0.4 = 12
Finance	$30 \ge 0.2 = 6$
Marketing	$30 \ge 0.3 = 9$
Rural Development	$30 \ge 0.1 = 3$
Total	30

Thus, proportionate sampling gives proper representation to each stratum and its statistical efficiency is generally higher. This method is, therefore, very popular.

Disproportionate Stratified Sampling:

In disproportionate stratified sampling, consideration is not given to the size of the stratum.

Complex Random Sampling Designs:

Under restricted sampling technique, the probability sampling may result in complex random sampling designs. Such designs are known as mixed sampling designs. Many of such designs may represent a combination of non-probability and probability sampling procedures in choosing a sample.

Some of the prominent complex random sampling designs are as follows:

Stratified Sampling:

When a population from which a sample is to be selected does not comprise a homogeneous group, stratified sampling technique is generally employed for obtaining a representative sample. Under stratified sampling, the population is divided into many sub-populations in such a manner that they are individually more homogeneous than the rest of the total population. Then, items are selected from each stratum to form a sample. As each stratum is more homogeneous than the remaining total population, the researcher is able to obtain a more precise estimate for each stratum and by estimating each of the component parts more accurately; he/she is able to obtain a better estimate of the whole. In sum, stratified sampling method yields more reliable and detailed information.

Cluster Sampling:

When the total area of research interest is large, a convenient way in which a sample can be selected is to divide the area into a number of smaller non-overlapping areas and then randomly selecting a number of such smaller areas. In the process, the ultimate sample would consist of all the units in these small areas or clusters. Thus in cluster sampling, the total population is sub-divided into numerous relatively smaller subdivisions, which in themselves constitute clusters of still smaller units. And then, some of such clusters are randomly chosen for inclusion in the overall sample. Some illustrations of clusters are:

Population	Elements	Cluster or sampling units
City	Households	Blocks
City	Individuals	Households
Affiliating University	Students	Affiliated colleges
Rural areas	Households	Villages
Industrial areas	Industrial unit	Industrial estates

Area Sampling:

When clusters are in the form of some geographic subdivisions, then cluster sampling is termed as area sampling. That is, when the primary sampling unit represents a cluster of units based on geographic area, the cluster designs are distinguished as area sampling. The merits and demerits of cluster sampling are equally applicable to area sampling.

Multi-Stage Sampling:

A further development of the principle of cluster sampling is multi-stage sampling. When the researcher desires to investigate the working efficiency of nationalized banks in India and a sample of few banks is required for this purpose, the first stage would be to select large primary sampling unit like the states in the country. Next, certain districts may be selected and all banks interviewed in the chosen districts. This represents a two-stage sampling design, with the ultimate sampling units being clusters of districts.

On the other hand, if instead of taking census of all banks within the selected districts, the researcher chooses certain towns and interviews all banks in it, this would represent three-stage sampling design. Again, if instead of taking a census of all banks within the selected towns, the researcher randomly selects sample banks from each selected town, then it represents a case of using a four-stage sampling plan. Thus, if the researcher selects randomly at all stages, then it is called as multi-stage random sampling design.

Sampling with Probability Proportional to Size:

When the case of cluster sampling units does not have exactly or approximately the same number of elements, it is better for the researcher to adopt a random selection process, where the probability of inclusion of each cluster in the sample tends to be proportional to the size of the cluster. For this, the number of elements in each cluster has to be listed, irrespective of the method used for ordering it. Then the researcher should systematically pick the required number of elements from the cumulative totals.

The actual numbers thus chosen would not however reflect the individual elements, but would indicate as to which cluster and how many from them are to be chosen by using simple random sampling or systematic sampling. The outcome of such sampling is equivalent to that of simple random sample. The method is also less cumbersome and is also relatively less expensive. Thus, a researcher has to pass through various stages of conducting research once the problem of interest has been selected. Research methodology familiarizes a researcher with the complex scientific methods of conducting research, which yield reliable results that are useful to policy-makers, government, industries etc. in decision-making.

Non-Probability Sampling:

Non-probability sampling is the sampling procedure that does not afford any basis for estimating the probability that each item in the population would have an equal chance of being included in the sample. Non-probability sampling is also known as deliberate sampling, judgment sampling and purposive sampling. Under this type of sampling, the items for the sample are deliberately chosen by the researcher; and his/her choice concerning the choice of items remains supreme. In other words, under non-probability sampling the researchers select a particular unit of the universe for forming a sample on the basis that the small number that is thus selected out of a huge one would be typical or representative of the whole population. For example, to study the economic conditions of people living in a state, a few towns or village may be purposively selected for an intensive study based on the principle that they are representative of the entire state. In such a case, the judgment of the researcher of the study assumes prime importance in this sampling design.

Quota Sampling:

Quota sampling is also an example of non-probability sampling. Under this sampling, the researchers simply assume quotas to be filled from different strata, with certain restrictions imposed on how they should be selected. This type of sampling is very convenient and is relatively less expensive. However, the samples selected using this method certainly do not satisfy the characteristics of random samples. They are essentially judgment samples and inferences drawn based on that, would not be amenable to statistical treatment in a formal way.

Accidental sampling:

Accidental sampling is also based upon convenience in accessing the sampling population. Whereas quota sampling attempts to include people possessing an obvious/visible characteristic, accidental sampling makes no such attempt. You stop collecting data when you reach the required number of respondents you decided to have in your sample. This method of sampling is common among market research and newspaper reporters. It has more or less the same advantages and disadvantages as quota sampling but, in addition, as you are not guided by any obvious characteristics, some people contacted may not have the required information.

Judge mental or purposive sampling:

The primary consideration in purposive sampling is your judgment as to who can provide the best information to achieve the objectives of your study. You as a researcher only go to those people who in your opinion are likely to have the required information and be willing to share it with you. This type of sampling is extremely useful when you want to construct a historical reality, describe a phenomenon or develop something about which only a little is known. This sampling strategy is more common in qualitative research, but when you use it in quantitative research you select a predetermined number of people who, in your judgement, are best positioned to provide you the needed information for your study.

Snowball sampling:

Snowball sampling is the process of selecting a sample using networks. To start with, a few individuals in a group or organization are selected and the required information is collected from them. They are then asked to identify other people in the group or organization, and the people selected by them become a part of the sample. Information is collected from them, and then these people are asked to identify other members of the group and, in turn, those identified become the basis of further data collection. This process is continued until the required number or a saturation point has been reached, in terms of the information being sought. This sampling technique is useful if you know little about the group or organisation you wish to study, as you need only to make contact with a few individuals, who can then direct you to the other members of the group. This method of selecting a sample is useful for studying communication patterns, decision making or diffusion of knowledge within a group. There are disadvantages to this technique, however. The choice of the entire sample rests upon the choice of individuals at the first stage. If they belong to a particular faction or have strong biases, the study may be biased.

Also, it is difficult to use this technique when the sample becomes fairly large.

Expert sampling:

The only difference between judgmental sampling and expert sampling is that in the case of the former it is entirely your judgement as to the ability of the respondents to contribute to the study. But in the case of expert sampling, your respondents must be known experts in the field of interest to you. This is again used in both types of research but more so in qualitative research studies. When you use it in qualitative research, the number of people you talk to is dependent upon the data saturation point whereas in quantitative research you decide on the number of experts to be contacted without considering the saturation point. You first identify persons with demonstrated or known expertise in an area of interest to you, seek their consent for participation, and then collect the information either individually or collectively in the form of a group.

Systematic Sampling:

In some cases, the best way of sampling is to select every first item on a list. Sampling of this kind is called as systematic sampling. An element of randomness is introduced in this type of sampling by using random numbers to select the unit with which to start. For example, if a 10 per cent sample is required out of 100 items, the first item would be selected randomly from the first low of item and thereafter every 10th item. In this kind of sampling, only the first unit is selected randomly, while rest of the units of the sample is chosen at fixed intervals.

Short Questions

- 1. Secondary data
- 2. What is a schedule? Explain
- 3. What is data classification?

- 4. Types of errors
- 5. Kinds of data
- 6. Sample design
- 7. Random sample
- 8. Need for survey
- 9. Exploratory research
- 10. Quota sampling
- 11. Qualities of a good questionnaire
- 12. Experimental research
- 13. Systematic sampling
- 14. Explain the sources of information
- 15. How can you determine sample size?
- 16. Sources of information

Essay Questions

- 1. What is a questionnaire? Explain the qualities of a good questionnaire.
- 2. What is sampling? Explain the probability sampling techniques in detail
- 3. Elucidate the ex- post facto research
- 4. Distinguish between measurement and evaluation.
- 5. Difference between questionnaire and schedule
- 6. What is data? Explain primary data collection methods in briefly
- 7. What is a questionnaire? Explain the general structure of a questionnaire.
- 8. What is the need for data collection? Kinds of data and point out where is a source of information.
- 9. What is the schedule? Discuss its validity of schedule as a data.
- 10. Explain various sampling methods.
- 11. Explain primary data collection methods in detail

Unit – III: Tabulation and Data Analysis

3.1. Tabulation and Cross Tabulation of Data

3.2. Univariate,

3.3. Bivariate

3.4 Data - Analysis and Interpretation

3.5. Testing of Hypothesis-

3.6. SPSS Packages and Applications

3.1 Tabulation of Data:Tabulation is a systematic & logical presentation of numeric data in rows and columns, to facilitate comparison and statistical analysis. To put it in other words, the method of placing organised data into a tabular form is called as tabulation. Tables can be classified according to their purpose and characteristics used.

Tabulation comprises sorting of the data into different categories and counting the number of cases that belong to each category. The simplest way to tabulate is to count the number of responses to one question. This is also called univariate tabulation. The analysis based on just one variable is obviously meager. Where two or more variables are involved in tabulation, it is called bivariate or multivariate tabulation. In marketing research, projects generally both types of tabulation are used.

3.1.1 Definition:

- Prof. Neiswanger has defined a statistical table as "In a systemic organisation of data in columns and rows."
- L. K Connor has defined tabulation as the orderly and systematic presentation of numerical data in a form designed to elucidate the problem under consideration

3.1.2 Objectives of Tabulation:

The following are the main objects of tabulation.

- To make the purpose of enquiry clear tabulation in the general scheme of statistics investigation is to arrange in easily accessible form.
- ➤ To make significance clear by arranging in form of table the significance of data, is made very clear. This is because table permits the observation of the whole data in one glance. The total information is clear to the view and the significance of different parts can easily be followed.
- ➤ To express the data in least space table also permits the data to be represented in least possible space, making the whole information clear to the view. If it is expressed in

form of a passage it would not only be difficult to follow, but would require more space too.

➤ To make comparison easy mainly because of the arrangement of figures in it. When two sets of figures are given side by side, it is much easier to form a comparative idea of their significance

3.1.3 Classification of tabulation:

- 1. Simple or one-way table
- 2. Two way table
- 3. Manifold table or Cross Tabulation:
- 1. Simple Tabulation or one-way table:
 - A simple or one-way table is the simplest table which contains data of one characteristic only.
 - It gives information about one or more groups of independent questions. This results, in one way table, provides information of one characteristics of data.
 - > A simple table is easy to construct and simple to follow.

The Number of adults in different occupations in a locality

Farmers	100
Other Farmers	100
Total	200

2. Two way table

- > A table, which contains data on two characteristics, is called a two way table.
- > Either stub or caption is divided into two co-ordinate parts
- For example the caption may be further divided in respect of 'sex'. This subdivision is shown in two-way table, which now contains two characteristics namely, occupation and sex.

The Number of adults in a locality in respect of Occupation and Sex

	No. of A	Total	
Occupation			
	Male	Female	
Labors	50	50	100
Total	50	50	100

3. Manifold table or Complex Tabulation or Cross Tabulation:

More and more complex tables can be formed by including other characteristics.

- For example, we may further classify the caption subheadings in the above table in respect of "marital status", "religion" and "socio-economic status" etc. A table, which has more than two characteristics of data, is considered as a manifold table. For instance, table shown below shows three characteristics namely, occupation, sex and marital status.
- In this type of tabulation, the data is divided in two or more categories which gives information regarding more sets of interrelated question.

The Number of adults in a locality in respect of Occupation, Sex and Marital status

Occupatio	N	No. of Adults				Total	
n	Male			Female	e		
Marital	Μ	U	Tota	М	U	Total	
status			1				

Labors	30	20	50	40	10	50	100
Total	30	20	50	40	10	50	100

Foot note: M Stands for Married and U Stands for Unmarried

3.2. Univariate data analysis

Univariate data: This type of data consists of only one variable. The analysis of univariate data is thus the simplest form of analysis since the information deals with only one quantity that changes. It does not deal with causes or relationships and the main purpose of the analysis is to describe the data and find patterns that exist within it. The example of a univariate data can be height.

Height							
(In	160	163	169.3	171	175	180	185
Cm.)							

suppose that the heights of seven students of a class is recorded (figure 1),there is only one variable that is height and it is not dealing with any cause or relationship. The description of patterns found in this type of data can be made by drawing conclusions using central tendency measures (mean, median and mode), dispersion or spread of data (range, minimum, maximum, quartiles, variance and standard deviation) and by using frequency distribution tables, histograms, pie charts, frequency polygon and bar charts.

3.3. Bivariate data: This type of data involves **two different variables**. The analysis of this type of data deals with causes and relationships and the analysis is done to find out the relationship among the two variables. Example of bivariate data can be temperature and ice cream sales in summer season.

Temperature (In Celsius)	Ice Cream Sales (No.)
23	1700
26	2400
36	4800
47	7100

Suppose the temperature and ice cream sales are the two variables of a bivariate data(the above Table). Here, the relationship is visible from the table that temperature and sales are directly proportional to each other and thus related because as the temperature increases, the sales also increase. Thus bivariate data analysis involves comparisons, relationships, causes and explanations. These variables are often plotted on X and Y axis on the graph for better understanding of data and one of these variables is independent while the other is dependent.

Differences be	etween uni ^s	variate and	bivariate	data.
		al lace alla	<i>NI</i> , <i>ul iucc</i>	unun.

Univariate Data	Bivariate Data
involving a single variable	involving two variables
\succ does not deal with causes or	deals with causes or relationships
relationships	▹ the major purpose of bivariate
> the major purpose of univariate	analysis is to explain
analysis is to describe	➤ analysis of two variables
➤ central tendency - mean, mode,	simultaneously correlations
median dispersion - range, variance,	comparisons, relationships, causes,
max, min,	\succ explanations tables where one
> quartiles, standard deviation.	variable is contingent
frequency distributions	\succ On the values of the other variable.
bar graph, histogram, pie chart, line	independent and dependent variables
graph, box-and-whisker plot	

3.4. Analysis of Data:

The data collected may or may not in numerical form. Even if data is not in numerical form still we can carry out qualitative analysis based on the experiences of individual participants. When data is collected in numerical form than through descriptive statistics findings can be summarized. This includes measure of central tendency like mean range etc. Another way to summarized finding is by means of graphs and charts. In any of the research study there is experimental hypothesis or null hypothesis one the basis of data of both hypothesis, various test have been devised to take decision. Where decision is taken on the basis statistical test, it is subject to error, and such correct decision is difficult. But some standard procedures followed to arrived at proper decision.

Analysis involves estimating the values of unknown parameters of the population and testing hypothesis for drawing inferences. The processing of data includes various operations which will be explained here.

130

3.4.1. Data interpretation is a crucial step in research. Data should not be studies in isolation of all factors which might influence the origin of the data. Any decision taken needs a holistic overview of paraphernalia factors associated with the subject in concern.

The data which is collected for the purpose of the study itself cannot several any things. This being a raw data it is required to process and analyzed in order to have desired result. The data which is collected cannot be directly use for making analysis. Before analysis data is requires to be processed.

3.4.2. Data processing is a crucial stage in research. After collecting the data from the field, the researcher has to process and analyze them in order to arrive at certain conclusion which may confirm or invalidate the hypothesis which he had formulated towards the beginning of his research worth. The

mass of data collected during the field work is to be processed with a view to reducing them to manageable proportions. The processing of data includes editing, coding, classification and tabulation. The data which is collected is analyze with an object checking of data, and reducing this data into manageable proportions. Data collected should be organized in such way so that table charts can be prepared for presentation. The processing of data includes various operations which will be explained here.

3.4.3. Meaning of Interpretation:

Interpretation refers to the task of drawing inferences from the collected facts after an analytical and/or experimental study. In fact, it is a search for broader meaning of research findings. The task of interpretation has two major aspects viz.,

- (i) the effort to establish continuity in research through linking the results of a given study with those of another, and
- (ii) The establishment of some explanatory concepts. "In one sense, interpretation is concerned with relationships within the collected data, partially overlapping analysis. Interpretation also extends beyond the data of the study to

include the results of other research, theory and hypotheses.

Thus, interpretation is the device through which the factors that seem to explain what has been observed by researcher in the course of the study can be better understood and it also provides a theoretical conception which can serve as a guide for further researches.

3.4.4. Technique of Interpretation:

The task of interpretation is not an easy job, rather it requires a great skill and dexterity on the part of researcher. Interpretation is an art that one learns through practice and experience. The researcher may, at times, seek the guidance from experts for accomplishing the task of interpretation.

The technique of interpretation often involves the following steps:

1) Researcher must give reasonable explanations of the relations which he has found and he must interpret the lines of relationship in terms of the underlying processes and must try to find out the thread of uniformity that lies under the surface layer of his diversified research findings. In
fact, this is the technique of how generalization should be done and concepts be formulated.

- 2) Extraneous information, if collected during the study, must be considered while interpreting the final results of research study, for it may prove to be a key factor in understanding the problem under consideration.
- 3) It is advisable, before embarking upon final interpretation, to consult someone having insight into the study and who is frank and honest and will not hesitate to point out omissions and errors in logical argumentation. Such a consultation will result in correct interpretation and, thus, will enhance the utility of research results.
- 4) Researcher must accomplish the task of interpretation only after considering all relevant factors affecting the problem to avoid false generalization. He must be in no hurry while interpreting results, for quite often the conclusions, which appear to be all right at the beginning, may not at all be accurate.

3.5. Hypothesis:

A supposition or proposed explanation made on the basis of limited evidence as a starting point for further investigation.One simply means a mere assumption or some supposition to be proved or disproved. But for a researcher hypothesis is a formal question that he intends to resolve. Thus a hypothesis may be defined as a proposition or a set of proposition set forth as an explanation for the occurrence of some specified group of phenomena either asserted merely as a provisional conjuncture to guide some investigation or accepted as highly probable in the light of established facts. Quite often a research hypothesis is a predictive statement, capable of being tested by scientific methods, that relates an independent variable to some dependent variable. For example, consider statements like the following ones:

"Students who receive counselling will show a greater increase in creativity than students not receiving counselling" Or "The automobile *A* is performing as well as automobile *B*."

These are hypotheses capable of being objectively verified and tested. Thus, we may conclude that a hypothesis states what we are looking for and it is a proposition which can be put to a test to determine its validity.

3.5.1 Characteristics of hypothesis:Hypothesis must possess the following characteristics:

- Hypothesis should be clear and precise. If the hypothesis is not clear and precise, the inferences drawn on its basis cannot be taken as reliable.
- > Hypothesis should be capable of being tested.
- Hypothesis should state relationship between variables, if it happens to be a relational hypothesis.
- Hypothesis should be limited in scope and must be specific. A researcher must remember that narrower hypotheses are generally more testable and he should develop such hypotheses.
- Hypothesis should be stated as far as possible in most simple terms so that the same is easily understandable by all concerned. But one must remember that simplicity of hypothesis has nothing to do with its significance.
- Hypothesis should be consistent with most known facts i.e., it must be consistent with a substantial body of established facts. In other words, it should be one which judges accept as being the most likely.
- ➢ Hypothesis should be amenable to testing within a reasonable time. One should not use even an excellent

hypothesis, if the same cannot be tested in reasonable time for one cannot spend a life-time collecting data to test it.

Hypothesis must explain the facts that gave rise to the need for explanation.

3.5.2 Basic Concepts Concerning Testing Of Hypotheses

Basic concepts in the context of testing of hypotheses need to be explained.

3.5.3 Null hypothesis and alternative hypothesis:

In the context of statistical analysis, we often talk about null hypothesis and alternative hypothesis. If we are to compare method A with method B about its superiority and if we proceed on the assumption that both methods are equally good, then this assumption is termed as the null hypothesis. As against this, we may think that the method A is superior or the method B is inferior, we are then stating what is termed as alternative hypothesis. The null hypothesis is generally symbolized as H0 and the alternative hypothesis as Ha.

Suppose we want to test the hypothesis that the population mean (μ) is equal to the hypothesized mean (μ *H*0) = 100. Then we would say that the null hypothesis is that the population mean is equal to the hypothesized mean 100 and symbolically we can express as:

*H*0:
$$\mu = \mu H0 = 100$$

If our sample results do not support this null hypothesis, we should conclude that something else is true. What we conclude rejecting the null hypothesis is known as alternative hypothesis. In other words, the set of alternatives to the null hypothesis is referred to as the alternative hypothesis. If we accept *H*0, then we are rejecting *Ha* and if we reject *H*0, then we are accepting *Ha*. For *H*0: $\mu = \mu H0 = 100$ we may consider three possible alternative hypotheses as follows.

Alternative	To be read as follows
hypothesis	
Ha : μ ≠μ <i>H</i> 0	(The alternative hypothesis is that the
	population mean is not
	equal to 100 i.e., it may be more or less
	than 100)

Ha : $\mu > \mu H0$	(The alternative hypothesis is that the			
	population mean is greater than 100)			
Ha: μ <μ <i>H</i> 0	(The alternative hypothesis is that the			
	population mean is less			
	than 100)			

The null hypothesis and the alternative hypothesis are chosen before the sample is drawn (the researcher must avoid the error of deriving hypotheses from the data that he collects and then testing the hypotheses from the same data). In the choice of null hypothesis, the following considerations are usually kept in view:

- i.Alternative hypothesis is usually the one which one wishes to prove and the null hypothesis is the one which one wishes to disprove. Thus, a null hypothesis represents the hypothesis we are trying to reject, and alternative hypothesis represents all other possibilities.
- ii.If the rejection of a certain hypothesis when it is actually true involves great risk, it is taken as null hypothesis because then the probability of rejecting it when it is true is (the level of significance) which is chosen very small.

iii.Null hypothesis should always be specific hypothesisi.e., it should not state about or approximately a certain value.

Generally, in hypothesis testing we proceed on the basis of null hypothesis, keeping the alternative hypothesis in view. Why so? The answer is that on the assumption that null hypothesis is true, one can assign the probabilities to different possible sample results, but this cannot be done if we proceed with the alternative hypothesis. Hence the use of null hypothesis (at times also known as statistical hypothesis) is quite frequent.

3.5.4 The level of significance: This is a very important concept in the context of hypothesis testing. It is always some percentage (usually 5%) which should be chosen with great care, thought and reason. In case we take the significance level at 5 per cent, then this implies that H0 will be rejected when the sampling result (i.e., observed evidence) has a less than 0.05 probability of occurring if H0 is true. In other words, the 5 per cent level of significance means that researcher is willing to take as much as a 5 per cent risk of rejecting the null hypothesis when it (H0) happens to be true. Thus the significance level is the maximum

value of the probability of rejecting *H*0 when it is true and is usually determined in advance before testing the hypothesis.

3.5.5 Decision rule or test of hypothesis: Given a hypothesis H0 and an alternative hypothesis Ha, we make a rule which is known as decision rule according to which we accept H0 (i.e., reject Ha) or reject H0 (i.e., accept Ha). For instance, if (H0 is that a certain lot is good (there are very few defective items in it) against Ha) that the lot is not good (there are too many defective items in it), then we must decide the number of items to be tested and the criterion for accepting or rejecting the hypothesis. We might test 10 items in the lot and plan our decision saying that if there are none or onlyb1 defective item among the 10, we will accept H0 otherwise we will reject H0 (or accept Ha). This sort of basis is known as decision rule.

3.5.6 **Type I and Type II errors**: In the context of testing of hypotheses, there are basically two types of errors we can make. We may reject *H*0 when *H*0 is true and we may accept *H*0 when in fact *H*0 is not true. The former is known as Type I error and the latter as Type II error. In other words, Type I error means rejection of hypothesis which should have been accepted and Type II error means accepting the hypothesis which should have

been rejected. Type I error is denoted by α (alpha) known as α error, also called the level of significance of test; and Type II error is denoted by β (beta) known as β error. In a tabular form the said two errors can be presented as follows:

	Decision			
	Accept H0	Reject H0		
H0 (true)	Correct	Type I error		
no (uue)	Decision	$(\alpha \text{ error})$		
H0 (false)	Type II error	Correct		
	(β error)	Decision		

The probability of Type I error is usually determined in advance and is understood as the level of significance of testing the hypothesis. If type I error is fixed at 5 per cent, it means that there are about 5 chances in 100 that we will reject *H*0 when *H*0 is true. We can control Type I error just by fixing it at a lower level. For instance, if we fix it at 1 per cent, we will say that the maximum probability of committing Type I error would only be 0.01.

But with a fixed sample size, n, when we try to reduce Type I error, the probability of committing Type II error

Both types of reduced increases. errors cannot be simultaneously. There is a trade-off between two types of errors which means that the probability of making one type of error can only be reduced if we are willing to increase the probability of making the other type of error. To deal with this trade-off in business situations, decision-makers decide the appropriate level of Type I error by examining the costs or penalties attached to both types of errors. If Type I error involves the time and trouble of reworking a batch of chemicals that should have been accepted, whereas Type II error means taking a chance that an entire group of users of this chemical compound will be poisoned, then in such a situation one should prefer a Type I error to a Type II error. As a result one must set very high level for Type I error in one's testing technique of a given hypothesis.2 Hence, in the testing of hypothesis, one must make all possible effort to strike an adequate balance between Type I and Type II errors.

3.6. Statistical Package for Social Science (SPSS)

Introduction: SPSS is a software package used for conducting statistical analysis, manipulating data, and generating table and

graphs that summarize data. SPSS performs statistical analysis range from basic descriptive statistics, such as average and prevalence, to advanced inferential statistical, such as regression model, analysis of variance (ANOVA), factor analysis etc. SPSS also contains several tools for manipulating data, including functions for recording data, macros programming on visual basic editor, merging data, and aggregating complex data sets.

SPSS stands for Statistical Package for the Social Sciences}

- SPSS Incorporated is leading worldwide provider of predictive analytics software and solutions.
- First version of SPSS was released in 1968, after being developed by Norman H. Nie, Dale H. Bentand C. Hadlai Hull.
- The company announced on July 28, 2009 that it was being acquired by IBM for US\$1.2 billion.
- Company Logo SPSS is now owned by IBM.
- Between 2009-10 the prime Vender of SPSS was called PASW (Predictive Analytics Software)

- ➢ IBM SPSS Statistics 21.0 − Released on August 2012 Latest version
- Compare groups to determine if there are significant differences between these groups example t-test, ANOVA etc.
- Examine Relationships between variables example correlation, regression, factor analysis etc.
- Describe data using descriptive statistics example frequency, mean, minimum and maximum.

3.6.1 Features and Benefits

- For Small And Medium Enterprises (SME)
- ➤ Resources & best practices.
- > Techniques for cleaning data.
- Access Data in Relational Databases.
- For Large Scale Enterprises (LSE)
- Real time processing and online mapping.
- > Online Database connectivity different networks.

- Data import & export data from different medium like SAS, Statistics.
- ➢ Compliances and Validations.

3.6.2Strengths

- Very robust statistical software
- Many complex statistical tests available
- ➢ Good "stats coach" help with interpreting results
- Easily and quickly displays data tables
- ➤ Can be expanded Using the syntax feature , Purchasing add-ins

3.6.3 Limitations

- \succ Can be expensive
- ➢ Not intuitive to use
- Typically requires additional training to maximize features (at a cost)
- ➢ Graphing feature not as simple as Excel

Short Questions

- 1. Define nominal and ordinal scale
- 2. Explain how SPSS is useful in Analysis of data.
- 3. Likert scale
- 4. Univariate
- 5. Level of significance
- 6. Tabulation
- 7. Null hypothesis

Essay Questions

- 1. Explain the concept of editing, coding and tabulation in detail
- 2. Discuss the role of SPSS in data analysis
- 3. Discuss various techniques used in data analysis
- 4. Explain briefly the testing of hypothesis
- 5. What is tabulation? Explain editing and coding
- 6. The procedure of testing hypotheses.
- 7. Explain the advantages of using SPSS package
- 8. Define scaling? Explain different types of scales

- 9. What is hypothesis? Explain the process of testing hypotheses.
- 10. How we use SPSS in analysis and interpretation of a study

Unit– IV: Multivariate Analysis

- 4.1. Advanced Techniques for Data Analysis
- 4.2. ANOVA,
- 4.3. Discriminate Analysis,
- 4.4. Factor Analysis,
- 4.5. Clustering Techniques,
- 4.6. Report Writing.

4.1. Multivariate Analysis (MVA) orAdvanced Techniques for Data Analysis:

This is exactly what **Multivariate analysis** is all about. So, analysis of multiple variables simultaneously would result in a better picture to arrive at inferences instead of multiple uni-variate analyses done with the individual variables. Statistical Techniques that simultaneously analyze multiple measurements of the observed variables are known as Multivariate analysis (MVA). We may perform MVA by using multiple variables in a single relationship or in multiple relationships. In a truly multivariate scenario, all variables must be random in nature, be inter-related and cannot be interpreted in isolation. Now, let us remember this example involving the variables for computing the fuel efficiency since we would be referring to the variables mentioned in the example more than once in this session.

Since we have been using the term variables, let see what we mean by it. Well..... the dictionary says that a variable is "an element, feature, or factor that is liable to vary or change". It does make sense doesn't it? All the above factors or variables can take different values depending on the measurement. For example the value of fuel efficiency would change when the values of the influencing variables change. So it is justified to call them variables. But the term **variate** is different. A computed *single* value of a **variate** consists of a set of variables in a linear relationship and each variable has an associated weight that is empirically determined. We can simply say that a variate result is a unitary value that represents a combination of the entire set of variables chosen to define the objective of the analysis.

The choice of the statistical technique depends on the nature of research problem or question and the nature of data set. The research questions to solve a research gap or problem may be related to identifying the degree of relationships among variables, checking for significance of group differences, predicting of group memberships or structure, or it could be time related. In-order to identify associations between two or more variables, depending on whether their nature of being parametric or non-parametric, correlation and regression or chi-square techniques may be adopted. This can be done as a Bivariate correlation and regression, multiple correlation and regression, ¹⁵⁰

Canonical correlation, Multiple Discriminant Analysis and Logit regression. The bivariate correlation is a good starting point to identify the degree of relationship between two continuous variables, such as engine capacity fuel efficiency where either of them can be treated as a DV and IV as the research question may be. But bi-variate regression would require one of them to be defined as the DV and the other as the IV. Although these are not multivariate techniques they form the basis of the MVA and are part of the General Linear Model (GLM).

4.1.1. Classification of Multivariate analysis

Multivariate analysis can be classified as

4.1.2. Dependence techniques (used when there is one or more dependent variable and independent variables. Eg. Multiple regression analysis)

- Multiple regression and multiple correlation
- Multiple Discriminate Analysis (MDA) and Logistic Regression
- Canonical Correlation Analysis
- Multivariate Analysis of Variance and Covariance
- Conjoint Analysis

Structural Equation Modelling (SEM) and Confirmatory Factor Analysis (CFA)

4.1.3. Interdependence techniques (absence of dependent or independent variables but involves techniques to simultaneously analyse all variables together in the set. Eg. Factor analysis)

- Factor Analysis (both Principal components analysis (PCA) and common factor
- ➤ analysis)
- Cluster Analysis
- Perceptual Mapping (also called as Multidimensional Scaling)
- Correspondence Analysis

4.1.4. Nature of data

The following table gives a summary of the nature of the data

Name of the Multivariate	Nature of the Data		
Technique	DV	IV	

Canonical Correlation	Metric, non-metric	Metric, non-metric
MANOVA	Metric	Non-metric
ANOVA	Metric	Non-metric
MDA	Non-metric	Metric
Multiple Regression	Metric	Metric, Non-metric
Conjoint Analysis	Non-metric, Metric	Non-metric
SEM	Metric	Metric, Non-metric

(Metrics are measures of quantitative assessment commonly used for assessing, comparing, and tracking performance or production)

4.1.5. Some generic tips to perform Multivariate Analyses

While performing MVA on the research problem, it would help if the researcher would observe the following tips.

1. Ensure that both statistical and practical significance exist in the research being done.

2. The sample size should be adequate but neither under sized or over sized.

3. Clearly understand the nature of the data.

4. Use minimum number of variables in the model to obtain the desired results.

5. Identify and eliminate errors and

6. Ensure a fool-proof validation of the results

4.2. Analysis of variance (ANOVA): is a collection of statistical models and their associated estimation procedures (such as the "variation" among and between groups) used to analyze the differences among group means in a sample. **ANOVA** was developed by statistician and evolutionary biologist Ronald Fisher.

4.2.1 The ANOVA Test

An **ANOVA** test is a way to find out if survey or experiment results are <u>significant</u>. In other words, they help you to figure out if you need to <u>reject the null hypothesis</u> or accept the <u>alternate hypothesis</u>.

Basically, you're testing groups to see if there's a difference between them.

Examples of when you might want to test different groups:

- A group of psychiatric patients are trying three different therapies: counseling, medication and biofeedback. You want to see if one therapy is better than the others.
- > A manufacturer has two different processes to make Ceiling fan. They want to know if one process is better than the other.

Students from different colleges take the same exam. You want to see if one college better performs than the other college.

4.2.2. What Does "One-Way" or "Two-Way Mean

One-way or **two-way** refers to the number of <u>independent</u> <u>variables</u> (IVs) in your Analysis of Variance test.

- One-way has one independent variable (with 2 levels). For example: **brand of cereal**,
- Two-way has two independent variables (it can have multiple levels). For example:

• brand of cereal, calories.

Breakfast Cereals					
Description				Serving	Calories (kcal)
Cereals ready-to-eat,	corn	flakes,	plain,		
single brand				1 cup	360

Cereals ready-to-eat, corn, rice, wheat, oats,		
presweetened, with fruit and almonds, single brand	1.25 cup	383
Cereals ready-to-eat, corn, whole wheat, rolled oats,		
presweetened, single brand	0.75 cup	394

4.2.3. What are "Groups" or "Levels?"

Groups or levels are different groups within the same independent variable. In the above example, your levels for "brand of cereal" might be Lucky Charms, Raisin Bran, and Cornflakes -a total of three levels. Your levels for "Calories" might be: sweetened, unsweetened - a total of two levels.

Let's say you are studying if an alcoholic support group and individual counseling combined is the most effective treatment for lowering alcohol consumption. You might split the study participants into three groups or levels:

- Medication only,
- Medication and counseling,
- Counseling only.

Your <u>dependent variable</u> would be the number of alcoholic beverages consumed per day.

If your groups or levels have a hierarchical structure (each level has unique subgroups), then use a nested (placed or stored one inside the other) for the analysis.

4.2.4. What Does "Replication" Mean?

It's whether you are replicating (i.e. duplicating) or (i.e. replication. DNA replication is the process by which a doublestranded DNA molecule is copied to produce two identical DNA molecules. **Replication** is essential process because, an whenever a cell divides, the two new daughter cells must contain the same genetic information, or DNA, as the parent test(s) with multiple groups. With cell) your a two wayANOVA with replication, you have two groups and individuals within that group are doing more than one thing (i.e. two groups of students from two colleges taking two tests). If you only have one group taking two tests, you would use without replication.

4.2.5. Types of Tests.

There are two main types: one-way and two-way. Two-way tests can be with or without replication.

- > One-way ANOVA between groups: used when you want to test two groups to see if there's a difference between them.
- > Two way ANOVA without replication: used when you have one group and you're double-testing that same group. For example, you're testing one set of individuals before and after they take a medication to see if it works or not.
- Two way ANOVA with replication: Two groups and the members of those groups are doing more than one thing.
 For example, two groups of patients from different hospitals trying two different therapies.

4.2.6. One Way ANOVA

A one way ANOVA is used to compare two means from two independent (unrelated) groups using the <u>F-distribution</u>. The <u>null</u> <u>hypothesis</u> for the test is that the two <u>means</u> are equal. Therefore, a <u>significant</u> result means that the two means are unequal. Examples of when to use a one way ANOVA

- Situation 1: You have a group of individuals randomly split into smaller groups and completing different tasks. For example, you might be studying the effects of tea on weight loss and form three groups: green tea, black tea, and no tea.
- Situation 2: Similar to situation 1, but in this case the individuals are split (i.e. break) into groups based on an attribute they possess. For example, you might be studying leg strength of people according to weight. You could split participants into weight categories (obese, overweight and normal) and measure their leg strength on a weight machine.

4.2.7. Limitations of the One Way ANOVA

A one way ANOVA will tell you that at least two groups were different from each other. But it won't tell you which groups were different. If your test returns a significant f-statistic, you may need to run an <u>ad hoc test</u> (like the <u>Least Significant Difference</u> test) to tell you exactly which groups had a <u>difference in means</u>. 4.2.8. Two Way ANOVA

A Two Way ANOVA is an extension of the One Way ANOVA. With a One Way, you have one <u>independent variable</u> affecting a <u>dependent</u> <u>variable</u>. With a Two Way ANOVA, there are two independents. Use a two way ANOVA when you have one <u>measurement variable</u> (i.e. a <u>quantitative variable</u>) and two <u>nominal variables</u>. In other words, if your experiment has a quantitative outcome and you have two categorical <u>explanatory variables</u>, a two way ANOVA is appropriate.

For example, you might want to find out if there is an interaction between income and gender for anxiety level at job interviews. The anxiety level is the outcome, or the variable that can be measured. Gender and Income are the two categorical variables. These categorical variables are also the independent variables, which are called factors in a Two Way

The factors can be split into levels. In the above example, income level could be split into three levels: low, middle and high income. Gender could be split into three levels: male, female, and transgender. Treatment groups are all possible combinations of the factors. In this example there would be 3 x 3 = 9 treatment groups.

4.2.9. Main Effect and Interaction Effect

The results from a Two Way ANOVA will calculate a<u>main</u> <u>effect</u> and an <u>interaction effect</u>. The main effect is similar to a One Way ANOVA: each factor's effect is considered separately. With the interaction effect, all factors are considered at the same time. Interaction effects between factors are easier to test if there is more than one observation in each cell. For the above example, multiple stress scores could be entered into cells. If you do enter multiple observations into cells, the number in each cell must be equal.

Two <u>null hypotheses</u> are tested if you are placing one observation in each cell. For this example, those hypotheses would be: H_{01} : All the income groups have equal mean stress. H_{02} : All the gender groups have equal mean stress.

For multiple observations in cells, you would also be testing a third hypothesis:

 H_{03} : The factors are independent **or** the interaction effect does not exist.

An <u>F-statistic</u> is computed for each hypothesis you are testing.

4.2.10. Assumptions for Two Way ANOVA

- > The population must be close to a normal distribution.
- <u>Samples</u> must be independent.
- > Population <u>variances</u> must be equal.
- > Groups must have equal <u>sample sizes</u>

4.3. Multiple Discriminant Analysis (MDA) and Logistic Regression Analysis

If the dependent variable is dichotomous (Yes/No, Men / Women) type then MDA is an appropriate technique. The independent variables need to be metric data. MDA helps to understand group differences and to predict the possibility that an observation or object would belong to a specific group. In example that we had discussed in MR in the previous section, suppose we had data on the engine capacity and un-laden weight of about 100 plus cars (that run on the same type of fuel) and if we want to class them as Big and Small cars then MDA would be a relevant technique.

Logistic Analysis also known as Logistics regression is a combination of MR and MDA. Although the regression principle is similar to that of MR, the DV in Logistic regression need not be metric as in the case of MR but can be a dichotomous variable as in MDA. Another, distinguishing fact of Logistic regression is that it can accommodate both metric and non-metric IVs and overlooks the multivariate normality assumption

4.4. Factor Analysis

The objective of factor analysis is to reduce the number of measured variables into meaningful factors (or variates) with minimal loss of information. This can either be done by the PCA (Principal components analysis) method or by common factor analysis. Suppose a prospective car buyer is considering the colour of the car, the aerodynamic design, body coloured bumpers, height adjustable steering column, driver seat height adjustment, touch screen for infotainment, ABS (Anti-lock Braking System) and Airbags. If the opinion of the car buyer is captured using a 7 point Likert' scale, either PCA or common factor analysis may group these eight variables in three groups, namely external features (colour of the car, the aerodynamic design, body coloured bumpers), internal features (height adjustable steering column, driver seat height adjustment, touch screen for infotainment) and safety features (ABS and Airbags).

So factor analysis helps us to reduce eight variables into three meaningful factors (variates).

4.4.1. Procedure of factor Analysis:

The relationship of each variable to the underlying factor is expressed by the so-called factor loading. Here is an example of the output of a simple factor analysis looking at indicators of wealth, with just six variables and two resulting factors.

Variables	Factor 1	Factor 2
Income	0.65	0.11
Education	0.59	0.25
Occupation	0.48	0.19
House value	0.38	0.60
Number of public parks in neighborhood	0.13	0.57
Number of violent crimes per year in	0.23	0.55
neighborhood		

The variable with the strongest association to the underlying latent variable. Factor 1, is income, with a factor loading of 0.65. Since factor loadings can be interpreted like <u>standardized regression</u> <u>coefficients</u>, one could also say that the variable income has a correlation of 0.65 with Factor 1. This would be considered a strong association for a factor analysis in most research fields. Two other variables, education and occupation, are also

associated with Factor 1. Based on the variables loading highly onto Factor 1, we could call it "Individual socioeconomic status."

House value, number of public parks, and number of violent crimes per year, however, have high factor loadings on the other factor, Factor 2. They seem to indicate the overall wealth within the neighbourhood, so we may want to call Factor 2 "Neighbourhood socioeconomic status."

Notice that the variable house value also is marginally important in Factor 1 (loading = 0.38). This makes sense, since the value of a person's house should be associated with his or her income.

4.5. Cluster Analysis

Cluster analysis is a statistical method used to group similar objects into respective categories. It can also be referred to as segmentation analysis, organization analysis, or clustering. The goal of performing a cluster analysis is to sort different objects or data points into groups in a manner that the degree of association between two objects is high if they belong to the same group and low if they belong to different groups.

In the car example that we have been discussing so far, suppose we have the data on engine capacities of about 130 cars. The engine capacities range from a minimum of 799 cc to 2399cc. If we want these 130 cars to be placed in three groups namely small, medium and large cars, cluster analysis would be a recommended technique. The Cluster analysis algorithm places the objects in homogenous groups depending on the characteristics specified by the researcher. In our example, the cars would be placed in groups based on engine capacity. Clustering can be done based on multiple characteristics too. Either hierarchical or non-hierarchical clustering procedures may be adopted. Basically hierarchical methods could be either agglomerative or divisive. The algorithms followed in the hierarchical methods are single, complete and average linkage methods. The other methods are the Centroid and Ward' methods. Alternatively the non-hierarchical clustering popularly follows the k-means algorithm and places objects in cluster groups once the number of clusters are specified. The decision on whether to adopt the hierarchical or non-hierarchical procedure depends on the choice of the researcher and the problem defined.

4.5.1. Common Applications of Cluster Analysis:

- Marketing: Marketers commonly use cluster analysis to develop market segments, which allow for better positioning of products and messaging. Company to better position itself; explore new markets, and development products that specific clusters find relevant and valuable.
- Insurance: Insurance companies often leverage cluster analysis if there are a high number of claims in a given region. This enables them to learn exactly what is driving this increase in claims.
- Education: What are student groups that need special attention? Researchers may measure psychological, aptitude, and achievement characteristics. A cluster analysis then may identify what homogeneous groups exist among students (for example, high achievers in all subjects, or students that excel in certain subjects but fail in others).
- Medicine: What are the diagnostic clusters? To answer this question the researcher would devise a diagnostic questionnaire that includes possible symptoms (for

example, in psychology, anxiety, depression etc.). The cluster analysis can then identify groups of patients that have similar symptoms.

4.5.2. Three Types of Cluster Analysis:

There are three primary methods used to perform cluster analysis:

- Hierarchical Cluster: This is the most common method of clustering. It creates a series of models with cluster solutions from 1 (all cases in one cluster) to n (each case is an individual cluster). This approach also works with variables instead of cases. Hierarchical clustering can group variables together in a manner similar to <u>factor analysis</u>. Finally, hierarchical cluster analysis can handle nominal, ordinal, and ratio scale data. But, remember not to mix different levels of measurement into your study.
- K-Means Cluster: This method is used to quickly cluster large datasets. Here, researchers define the number of clusters prior to performing the actual study. This approach

is useful when testing different models with a different assumed number of clusters.

Two-Step Cluster: This method uses a cluster algorithm to identify groupings by performing pre-clustering first, and then performing hierarchical methods. Two-step clustering is best for handling larger datasets that would otherwise take too long a time to calculate with strictly hierarchical methods. Essentially, two-step cluster analysis is a combination of hierarchical and k-means cluster analysis. It can handle both scale and ordinal data and it automatically selects the number of clusters.

4.5.3. Process of Cluster Analysis:

Step 1: Build and Distribute a Survey: Your survey should be designed to include multiple measures of propensity to purchase and the preferences for the product at hand. It should be distributed to your population of interest, and your sample size should be large enough to inform statistically-based decisions.
Step 2: Analyze Response Data: It's considered best practice to perform a factor analysis on your survey to minimize the factors being clustered. If after your factor analysis it's concluded that a handful of questions are measuring the same thing, you should combine these questions prior to performing your cluster analysis.

After reducing your data by factoring, perform the cluster analysis and decide how many clusters seem appropriate, and record those cluster assignments. You'll now be able to view the means of all of your factors across clusters.

Step 3: Take informed opinion: Search through your data to identify differences in the means of factors, and name your clusters based on these differences. These differences between clusters are then able to inform your marketing, allowing you to target precise groups of customers with the right message, at the right time, in the right manner.

4.6. Report Writing:

Research report is considered a major component of the research study for the research task remains incomplete till the report has been presented or written. As a matter of fact even the most brilliant hypothesis, highly well designed and conducted research study, and the most striking generalizations and findings are of little value unless they are effectively communicated to others. The purpose of research is not well served unless the findings are made known to others. Research results must invariably enter the general store of knowledge. All this explains the significance of writing research report. There are people who do not consider writing of report as an integral part of the research process. But the general opinion is in favor of treating the presentation of researchresults or the writing of report as part and parcel of the research project. Writing of report is the laststep in a research study and requires a set of skills somewhat different from those called for inrespect of the earlier stages of research. This task should be accomplished by the researcher withutmost care; he may seek the assistance and guidance of experts for the purpose

4.6.1. Different Steps in Writing Report

Research reports are the product of slow, painstaking, accurate inductive work. The usual steps involved in writing report are:

1. logical analysis of the subject-matter;

- 2. preparation of the final outline;
- 3. preparation of the rough draft;
- 4. rewriting and polishing;
- 5. preparation of the final bibliography; and
- 6. Writing the final draft.

Though all these steps are self explanatory, yet a brief mention of each one of these will be appropriate for better understanding.

1. Logical analysis of the subject matter: It is the first step which is primarily concerned with the development of a subject.

There are **two ways** in which to develop a subject

- Logical: The logical development is made on the basis of mental connections and associations between the one thing and another by means of analysis. Logical treatment often consists in developing the material from the simple possible to the most complex structures
- 2. Chronological: Chronological development is based on a connection or sequence in time or occurrence. The directions for doing or making something usually follow the chronological order.

2. Preparation of the final outline: It is the next step in writing the research report "Outlines are the framework upon which long written works are constructed. They are an aid to the logical organization of the material and a reminder of the points to be stressed in the report."

3. Preparation of the rough draft:This follows the logical analysis of the subject and the preparation of the final outline. Such a step is of utmost importance for the researcher now sits to write down what he has done in the context of his research study. He will write down the procedure adopted by him in collecting the material for his study along with various limitations faced by him, the technique of analysis adopted by him, the broad findings and generalizations and the various suggestions he wants to offer regarding the problem concerned.

4. Rewriting and polishing of the rough draft: This step happens to be most difficult part of all formal writing. Usually this step requires more time than the writing of the rough draft. The careful revision makes the difference between a mediocre and a good piece of writing. While rewriting and polishing, one should check the report for weaknesses in logical development or presentation. The researcher should also "see whether or not

the material, as it is presented, has unity and cohesion; does the report stand upright and firm and exhibit a definite pattern, like a marble arch? Or does it resemble an old wall of moldering cement and loose brick." In addition the researcher should give due attention to the fact that in his rough draft he has been consistent or not. He should check the mechanics of writing grammar, spelling and usage.

5. Preparation of the final bibliography:Next in order comes the task of the preparation of the final bibliography. The bibliography, which is generally included to the research report, is a list of books in some way pertinent to the research which has been done. It should contain all those works which the researcher has consulted.

The bibliography should be arranged alphabetically and may be divided into **two parts**;

- 1. The first part may contain the names of books and pamphlets, and
- 2. The second part may contain the names of magazine and newspaper articles.

Generally, this pattern of bibliography is considered convenient and satisfactory from the point of view of reader, though it is not the only way of presenting bibliography. The entries in bibliography should be made adopting the following order:

For books and pamphlets the order may be as under:

- 1. Name of author, last name first.
- 2. Title, underlined to indicate italics.
- 3. Place, publisher, and date of publication.
- 4. Number of volumes.

Example

Kothari, C.R., *Quantitative Techniques*, New Delhi, Vikas Publishing House Pvt. Ltd., 1978.

For magazines and newspapers the order may be as under:

- 1. Name of the author, last name first.
- 2. Title of article, in quotation marks.
- 3. Name of periodical, underlined to indicate italics.
- 4. The volume or volume and number.
- 5. The date of the issue.
- 6. The pagination.

Example

Robert V. Roosa, "Coping with Short-term International Money Flows", *The Banker*, London, September, 1971, p. 995. The above examples are just the samples for bibliography entries and may be used, but one should also remember that they are not the only acceptable forms. The only thing important is that, whatever method one selects, it must remain consistent.

6. Writing the final draft: This constitutes the last step. The final draft should be written in a concise and objective style and in simple language, avoiding vague expressions such as "it seems", "there may be", and the like ones. While writing the final draft, the researcher must avoid abstract terminology and technical jargon(special words or expressions used by a profession or group that are difficult for others to understand). Illustrations and examples based on common experiences must be incorporated in the final draft as they happen to be most effective in communicating the research findings to others. A research report should not be dull, but must enthuse people and maintain interest and must show originality. It must be remembered that every report should be an attempt to solve some intellectual problem and must contribute to the solution of a problem and must add to the knowledge of both the researcher and the reader.

Layout of the Research Report

Anybody, who is reading the research report, must necessarily be conveyed enough about the study so that he can place it in its general scientific context, judge the adequacy of its methods and thus form an opinion of how seriously the findings are to be taken. For this purpose there is the need of proper layout of the report. The layout of the report means as to what the research report should contain. A comprehensive layout of the research report should comprise.

- 1. Preliminary pages;
- 2. The main text; and
- 3. The end matter. Let us deal each point above separately.

1. Preliminary Pages

In its preliminary pages the report should carry a title, author names and date, followed by acknowledgements in the form of 'Preface' or 'Foreword'. Then there should be a table of contents followed by list of tables, list of charts, list of graphs and illustrations so that the decision-maker or anybody interested in reading the report can easily locate the required information in the report.

2. Main Text

The main text provides the complete outline of the research report along with all details. Title of the research study is repeated at the top of the first page of the main text and then follows the other details on pages numbered consecutively, beginning with the second page. Each main section of the report should begin on a new page. The main text of the report should have the following sections:

- 1. Introduction;
- 2. Statement of findings and recommendations;
- 3. The results;
- 4. The implications drawn from the results; and
- 5. The summary.
- **1. Introduction**: The purpose of introduction is to introduce the research project to the readers. It should contain a clear statement of the objectives of research i.e., enough background should be given to make clear to the reader why the problem was considered worth investigating. A brief summary of other relevant research may also be stated so that the present study can be seen in that context. The hypotheses of study, if any, and the definitions of the major

concepts employed in the study should be explicitly stated in the introduction of the report.

The methodology adopted in conducting the study must be fully explained. The scientific reader would like to know in detail about such thing:

- \succ How was the study carried out?
- ➤ What was its basic design?
- If the study was an experimental one, then what were the experimental manipulations?
- If the data were collected by means of questionnaires or interviews, then exactly what questions were asked (The questionnaire or interview schedule is usually given in an appendix)?
- If measurements were based on observation, then what instructions were given to the observers?
- Regarding the sample used in the study the reader should be told:
- ➤ Who were the subjects?
- ➤ How many were there?
- ≻ How were they selected?

All these questions are crucial for estimating the probable limits of Generalizations ability of the findings. The statistical analysis adopted must also be clearly stated. In addition to all this, the scope of the study should be stated and the boundary lines be demarcated. The various limitations, under which the research project was completed, must also be narrated.

- **2. Statement of findings and recommendations:** After introduction, the research report must contain a statement of findings and recommendations in non-technical language so that it can be easily understood by all concerned. If the findings happen to be extensive, at this point they should be put in the summarized form.
- **3. Results:** A detailed presentation of the findings of the study, with supporting data in the form of tables and charts together with a validation of results, is the next step in writing the main text of the report. This generally comprises the main body of the report, extending over several chapters. The result section of the report should contain statistical summaries and reductions of the data rather than the raw data. All the results should be presented in logical sequence and spitted into readily identifiable

sections. All relevant results must find a place in the report. But how one is to decide about what is relevant is the basic question. Quite often guidance comes primarily from the research problem and from the hypotheses, if any, with which the study was concerned. But ultimately the researcher must rely on his own judgment in deciding the outline of his report. "Nevertheless, it is still necessary that he states clearly the problem with which he was concerned, the procedure by which he worked on the problem, the conclusions at which he arrived, and the bases for his conclusions."

- **4. Implications of the results**:Toward the end of the main text, the researcher should again put down the results of his research clearly and precisely. He should, state the implications that flow from the results of the study, for the general reader is interested in the implications for understanding the human behaviour. Such implications may have three aspects as stated below:
- a) A statement of the inferences drawn from the present study which may be expected to apply in similar circumstances.

- b) The conditions of the present study which may limit the extent of legitimate generalizations of the inferences drawn from the study.
- c) The relevant questions that still remain unanswered or new questions raised by the study along with suggestions for the kind of research that would provide answers for them.

It is considered a good practice to finish the report with a short conclusion which summarises and recapitulates the main points of the study. The conclusion drawn from the study should be clearly related to the hypotheses that were stated in the introductory section. At the same time, a forecast of the probable future of the subject and an indication of the kind of research which needs to be done in that particular field is useful and desirable.

5. **Summary:**It has become customary to conclude the research report with a very brief summary, resting in brief the research problem, the methodology, the major findings and the major conclusions drawn from the research results.

3. End Matter:

At the end of the report, appendices should be enlisted in respect of all technical data such as questionnaires, sample information, mathematical derivations and the like ones. Bibliography of sources consulted should also be given. Index (an alphabetical listing of names, places and topics along with the numbers of the pages in a book or report on which they are mentioned or discussed) should invariably be given at the end of the report. The value of index lies in the fact that it works as a guide to the reader for the contents in the report.

Short Questions

- 1. What is multivariate analysis? Explain
- 2. Explain the concept of cluster analysis
- 3. Factor analysis
- 4. Decision reports
- 5. Bibliography
- 6. Footnotes

Essay Questions

- 1. Discuss the structure of a research report in detail
- 2. What is data analysis? Explain the use of factor analysis in data analysis with suitable example.
- 3. Define a Research report and explain its purpose.

- 4. What is the purpose of footnotes? what are the different kinds of footnotes
- 5. Explain the need and importance of report writing
- 6. What is factor analysis? Explain the procedure.
- 7. What is the general structure of a research report
- 8. What is cluster analysis? Explain its procedure.
- 9. What are quotations used in a research report? Explain briefly
- 10. What points have to be kept in mind while revising the draft report
- 11. What is a Research report? Explain the format of a research report
- 12. What is ANOVA? Explain its usage in business applications. Also explain the procedure

Unit – V: Business Analytics

5.1. Evolution of Business Analytics

5.2. Master Data Management
5.3. Data Warehousing
5.4. Transformation and Up-loading of Data
5.5. Data Mining
5.6. Meta Data
5.7. Data Marts
5.8. Data Integration
5.9. OLAP
5.10. OLTP

5.1. Evolution of Business Analytics:

Analytics has been an integral part of a firm's operation since early times. However with the passage of time analytics has become more Complex and refined and wide in its applications. The term 'business analytics' has evolved over the period of time.

5.1.1 The decision support system: emerged in the 1970s and was designed to serve the needs of the managers in the organization. These systems are captured in the internal information through the daily transaction reports on regular

reports. Along with this is the systems also capture external data. This data is then analyzed using various modeling software. This feature also allows the users to work directly and they are flexible enough to answer a large number of queries of the users. They are interactive systems that allow the user to change assumptions, include new data and ask more and more questions. The main components of a decision support system are a database, a software system and a user interface.

The growth of the concept of business analytics

5.1.2. The executive support system: evolves to a higher level that supports non-routine decision making. These systems are generally used by senior level managers who often have to handle non-routine strategic decision making. These systems have the ability to filter, spot and track critical data and thus

help the managers make a well informed decision. They became popular during the 1980s decade .These systems were superior as they had good computing and communicating capabilities that was designed to solve not a specific problem but were rather capable of solving a wide array of problems.

5.1.3. Online Analytical Processing (OLAP): The major development in the series of analytical processing was the emergence of online analytical processing (OLAP). It allowed the organisation to perform analysis along multiple dimensions. It is the dynamic synthesis, analysis and consolidation of large value of multidimensional data. It enables users to gain a deeper understanding and knowledge about various aspects of their corporate data through past consistent and interactive access to a wide variety of possible views of the data. The same data is viewed from different angles with each viewpoint having a new interpretation.

5.1.4. **Business Intelligence:** the evolution of a better analytical capability is, the firm's moved to business intelligence IBM researcher Hans Peter Luhn coined the term business intelligence and defines business intelligence as "the ability to understand the interrelationship of presented facts in such a way

as to guide action towards a desired goal" it combined the data with the analytical abilities to support better decision making. It turns raw data into an actionable form. It involves the process of accessing data, formatting it and delivering it inside and outside the organization. It makes use of various data mining techniques to identify patterns and unearth(to discover something in the ground)relationships. It tries to establish a correlation between data and Real world objects and there after predictive probabilities and trends.

Some of the applications of business intelligence are:

- To study the consumer behavior
- To develop and manage customer relationships
- To conduct detailed sales analysis and forecast future sales
- Budgeting and financial planning and forecasting
- > To design effective delivery and supply chain
- To develop enhanced decision making under risk and uncertainty
- Increase organization's effectiveness and boost internal productivity
- Business intelligence is an important tool that empowers the employees by giving them access to real time analytical

and operational data. This increases the work efficiency of the employees. With the passage of time business intelligence has become more and more specialized and from its core emerges the concept of business analytics.

5.1.5. Business analytics: business analytics is the use of information technology, modeling software on the data to find solutions to the problems being faced by the business. It is the use of various applications on the large volume of data being generated in the organisation to reveal meaningful relationships and patterns. It has been defined as "the study of data through statistical and operation analysis, the formation of predictive models, applications of Optimisation techniques and the communication of these results to customers, business patterns and executives".

- According to Liberto and Luo, business analytics is the " process of transforming data into actions through analysis and insights in the context of organisational decision making and problem solving"
- 2) As per James R Evans " business analytics is the use of data information, technology , statistical analysis quantitative methods, mathematical or Computer Based

models to help managers gain improved insight about their

business operations and make a better fact based decisions' Business analytics has found widespread applications in the managerial decision making. Some of the areas where decision making using analytics as improved are are;

- Pricing decision
- Market segmentation
- Positioning decisions
- Location decisions

5.2. Master Data Management

5.2.1. Meaning of Master Data is the data which refers to Core business entities and Organisation uses repeatedly across many business processes and Systems.

Master Data captures the key things that all parts of an organisation must agree on both in meaning and in usage. Master Data includes the business objectives, definitions, classification and terminology that constitute business information, consequently Master Data forms the business for business Processes.

5.2.2. Definition of Master Data Management

Master Data Management Is a collection of best data management practices that coordinate key stakeholders, participants and business clients in incorporating the business applications, information management methods, And data management tools to implement the policies, procedures services, and infrastructure to support the capture integration and subsequent shared use of accurate timely, consistent and complete Master Data.

5.2.3. List out the Characteristics of good Master Data Management System

In order to successfully manage the Master Data support corporate governance and augment business intelligence systems The Master Data Management applications must have the following characteristics.

- A metadata management capability for items such as business entity Matrixes relationship and hierarchies.
- A source system management capability to fully cross - reference business objects and to satisfy seemingly conflicting data ownership requirements.

- A data quality function that can find and eliminate Duplicate data while ensuring correct data attribute superior ship
- A Data quality interface to assist with preventing new errors from entering the System even when data entry to outside the Master Data Management applications itself.
- A Continuing data cleansing function to keep the data up to date.
- An integral set off mechanism to create and position change information to all connected systems
- A comprehensive data security system to control and monitor data access, update rights and maintain change history.

5.2.4. Advantages of Master Data Management

Business concerns how many advantages with the maintenance of Master Data Management, the benefits are as follows.

Increase information quality

Improve business productivity and operational efficiency

Improve interoperability

Improve governance, regulatory compliance and risk

- Simplify and accelerate application development
- Enable consistent reporting and improve decision making
- Enable comprehensive customer knowledge

5.3. Data warehousing

5.3.1. Meaning of data warehouse: A large storage of data accumulated from a wide range of sources within a company and used to guide management decisions.

a data warehouse also known as an enterprise data warehouse is a system used for reporting and data analysis and is considered a core component of business intelligence

5.3.2. Definition of data warehousing: the process of constructing and using a data warehouse can be defined as data warehousing. A data warehouse is constructed by integrating data from multiple heterogeneous sources that support analytical reporting, structured and ad hoc queries and decision making. Data warehousing involves data cleaning data integration and data consolidation.

5.3.3Features of data warehouse:

- 1. **Subject oriented**: a data warehouse is subject oriented because it provides information around a subject rather than the organisation's on-going operations. These subjects can be product, customers, suppliers, sale, revenues etc. a data warehouse does not focus on the on-going operations, rather it focuses on Modelling and Analysis of data for decision making.
- 2. **Integrated:** data warehouse is constructed by integrating data from Heterogeneous sources such as a relational databases, flat files etc. This integration enhances the effective Analysis of data.
- 3. **Time variant:** the data collected in data warehouse in identified with a particular time period. The data in a data warehouse provides information from the historical point of view.
- 4. Non-volatile: non-volatile means the provides a data is not erased when new added to it. A data warehouse is kept separate from the operational database and therefore frequent changes in operational database is not reflected in the data warehouse.

- **5.3.4.** Functions of data warehouse tools.
 - 1. **Data extraction**: involves gathering data from multiple heterogeneous sources.
 - 2. **Data cleaning**: involves finding and correcting the errors in data.
 - 3. **Data transformation**: involves converting the data from Legacy format to warehouse format.
 - 4. **Data loading:** involves storing, summarising, consolidating checking, integrity e building indices and partitions.
 - 5. **Repressing**: involves updating from Data sources to warehouse.

5.3.5. Advantages of data warehousing

Maintenance of data warehouses will yield different benefits to the users, which are as follows.

- Data warehouse maintains data history, even if the source transaction systems do not.
- It integrates data from multiple source systems, enabling a Central View across the Enterprise this benefit is always valuable, but particularly so when the organisation has grown by Merger.

- Data warehouse improve data quality, by providing consistent codes and descriptions weakening. or even fixing bad data.
- \succ it presents The organisations information consistently
- Data warehouse provides a single common data model for all data of interest regardless of the data's source.

5.4. Extraction, transformation, and loading (ETL):

Processes are responsible for the operations taking place in the background of data warehouse architecture. In a high leveldescription of an ETL process, first, the data are extracted from the source data stores that can be on-line transaction processing (OLTP) or legacy systems, files under any format, web pages, various kinds of documents (e.g., spreadsheets and text documents) or even data coming in a streaming fashion. Typically, only the data that are different from the previous execution of an ETL process (newly inserted, updated, and deleted information) should be extracted from the sources. Secondly, the extracted data are propagated to a special-purpose area of the warehouse, called the data staging area (DSA), where

their transformation, homogenization, and cleansing take place. The most frequently used transformations.

5.4.**Data Mining:** Data mining finds it greatest application in retail sector. Data mining is a powerful tool in the hands of a marketing manager where he can make some general observations like spotting the sales trend or perform some specific actions like design one to one marketing and design personalized messages to engage the customers fully with the organisations.

5.5.1The Advantages of Data Mining:

- Market Segmentation: Identify the common characteristics of customers who buy the same products from your company
- Customer churn: Predict which customers are likely to leave your company and go to a competitor.
- Fraud Detection: Identify which transactions are most likely to be fraudulent

- Direct Marketing: Identify which prospects should be included in a mailing list of obtain the highest response rate
- Interactive Marketing: Predict what each individual assessing a web site is most likely interested in seeing
- Market Basket Analysis: Understand what products are services are commonly purchased together
- Trend Analysis: Reveal the differences between a typical customer this month and last

5.6. Meta data

The term Often used in the context of database is 'meta data' It means data about data. The objects in a database have attributes that describe the date. Example the date item 'name' can be described in terms of the nature of data item, its size, its length etc. All this information about the attributes of the data object is called as metadata for example a field by the name of 'address' exists in the database. This field has been divided into three sub fields, namely house number, street name, locality. The information about the individual address details is the data content of the database. At the same time information about each of these subfields in terms of The Identity, data type, count etc. Is also stored.

5.7. Data marts

A date mart is a subset of data warehouse that contains some of the data that is contained in a data warehouse. it is a subject oriented database and it generally caters to the needs of the middle level managers in an organisation. General different department within the Organisation may create these departments in Order to have a subset of data specific to their department. The data in specific to some user type which makes it easy for the user to construct analysis on this.

5.8. Data integration

It is the process of combining data from disparate sources to present a Unified of view of data. Generally it involves the process of Discovery, cleansing monitoring and transformation of data. The objective of data integration is to consolidate the data from various sources while still maintaining the integrity and quality of data. Generally for any business organisation data integration ensures consistent, trusted and reliable real time date.

5.9. Online Analytical Processing (OLAP):

5.9.1 Define OLAP: OLAP stands for online analytical processing, which is characterized by relatively low volume of transactions. Queries are often very complex and involve aggregations. For OLAP systems a response time is an effectiveness measure. OLAP applications are widely used by data mining techniques. In OLAP database there is aggregated, historical data stored in multi-dimensional schemas.

5.9.2. Characteristics of OLAP

According to business intelligence Limited OLAP Can be defined in 5 words Past Analysis of Share Multidimensional Information (FASMI)

- 1. **Fast:** past means that the system targeted to deliver most responses to use within about 5 second, with the simplest analysis taking no more than one second and very few taking more than 20 seconds.
- 2. **Analysis**: analysis means that the system can cope with any business logic and statistical analysis that it relevant for the application and other user keep it easy enough for the target user.
- 3. **Share:** share means that the system implements the entire security requirement for confidentiality and if multiple write access is needed, concurrent update location at an appropriated level not all applications need uses to write data back but for the growing number that do, The system should be able to handle multiple updates in a timely secure manner.
- 4. Multidimensional: multidimensional is the key requirement. OLAP system must provide a multidimensional conceptual view of the data including Full support for hierarchies, as This Certainly the most logical way to analyse business and Organisation.

5. **Information:** information is all of the data and derived information needed. Wherever it is and however much is relevant for the application. We are measuring the capacity of various product in terms of how much input data they can handle, not how many Giga bytes they take to store it.

5.10. Online Transaction Processing (OLTP):

5.10.1 Define OLTP: OLTP Stands for online transaction processing which is characterized by a large number of start online transaction (read, insert, update and delete) The main purposes for OLTP systems is put on very fast query processing, maintaining Data integrity in multi access environment and an effectiveness measured by number of transactions per second. In OLTP database there is a detailed and current data and schema used to store transactional databases in the entity model.

5.10.2 Kinds of processing in OLTP: generally the data in an OLTP can be processed using any of the 3 methods of batch processing, online processing or online validation with batch processing

- 1. Batch Processing.
- 2. Online Transaction Processing and
- 3. Online Entry With Batch Processing

5.10.3. A Comparison of OLTP and OLAP

Parameters	OLTP	OLAP
Purpose	Designed for real time business	Designed for analysis of
	operations.	business measures by category
		and attributes.
Source	OLTP and its transactions are	Different OLTP databases
	the sources of data.	become the source of data for
		OLAP.
Design	DB design is application	DB design is subject oriented.
	oriented. Example: Database	Example: Database design

	design changes with industry	changes with subjects like sales,
	like Retail, Airline, Banking, etc.	marketing, purchasing, etc.
Process	It is an online transactional	OLAP is an online analysis and
	system. It manages database	data retrieving process.
	modification.	
Characteristic	It is characterized by large	It is characterized by a large
	numbers of short online	volume of data.
	transactions.	
Method	OLTP uses traditional DBMS.	OLAP uses the data warehouse.
Functionality	OLTP is an online database	OLAP is an online database
	modifying system.	query management system.
Response time	Its response time is in	Response time in seconds to
	millisecond.	minutes.
Usefulness	It helps to control and run	It helps with planning, problem-
	fundamental business tasks.	solving, and decision support.
Productivity	It helps to Increase user's self-	Help to Increase productivity of
	service and productivity	the business analysts.

Short Questions

- 1. Data integration
- 2. Scope of business analytics.
- 3. Data warehousing
- 4. Business analytics

Essay Questions

- 1. What is data mining? Explain in detail
- 2. Explain the importance and evolution of Business analytics
- 3. Discuss the concept of data mining
- 4. Briefly explain the master data management in detail.
- 5. Explain the concept of transformation and uploading of data.
- 6. Difference between of OLTP and OLAP.

INTRODUCTION

Intellectual property Right (IPR) is a term used for various legal entitlements which attach to certain types of information, ideas, or other intangibles in their expressed form. The holder of this legal entitlement is generally entitled to exercise various exclusive rights in relation to the subject matter of the Intellectual Property. Intellectual property, very broadly, means the legal rights which result from intellectual activity in the industrial, scientific, literary and artistic fields. Countries have laws to protect intellectual property for two main reasons. One is to give statutory expression to the moral and economic rights of creators in their creations and the rights of the public in access to those creations. The second is to promote, as a deliberate act of Government policy, creativity and the dissemination and application of its results and to encourage fair trading which would contribute to economic and social development.

IPR have become important in the face of changing trade environment which is characterized by global competition, high innovation risks, short product cycle, need for rapid changes in technology, high investments in research and development (R&D), production and marketing and need for highly skilled human resources. Intellectual Property (IP) is the fuel that powers the engine of prosperity, fostering invention and innovation. The increasing significance of intangible assets in the global economy is forcing business organizations to actively manage their IP as a key driver for building and sustaining their competitive advantage and achieving superior performance. IPRs play a crucial role as the legal vehicle through which either the transfer of knowledge or the contractual relationship is affected. In India several new legislations for the protection of intellectual property rights (IPRs) have been passed to meet the international obligations under the WTO Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS).

INTELLECTUAL PROPERTY

Intellectual property is an intangible creation of the human mind, usually expressed or translated into a tangible form that is assigned certain rights of property. The domain of intellectual property is vast. IP refers to creations of the mind: inventions, literary and artistic works, and symbols, names, images, and designs used in commerce.

INTELLECTUAL PROPERTY RIGHTS:

Intellectual property rights (IPR) can be defined as the rights given to people over the creation of their minds. They usually give the creator an exclusive right over the use of his/her creations for a certain period of time.

The different types of Intellectual Property Rights are: Patents, Copyrights; Trademarks; Industrial designs; Protection of Integrated Circuits layout design; Geographical indications of goods; Biological diversity; Plant varieties and farmers rights; Undisclosed information;

PATENT

Patent is a grant for an invention by the Government to the inventor in exchange for full disclosure of the invention. A patent is an exclusive right granted by law to applicants / assignees to make use of and exploit their inventions for a limited period of time (generally 20 years from filing). The patent holder has the legal right to exclude others from commercially exploiting his invention for the duration of this period.

COPYRIGHTS

Copyright is the set of exclusive rights granted to the author or creator of an original work, including the right to copy, distribute and adapt the work. Copyright gives protection for the expression of an idea and not for the idea itself. The protection provided by copyright to the efforts of writers, artists, designers, dramatists, musicians, architects and producers of sound recordings, cinematograph films and computer software, creates an atmosphere conducive to creativity, which induces them to create more and motivates others to create.

TRADEMARK

A trade mark (popularly known as brand name) in layman's language is a visual symbol which may be a word signature, name, device, label, numerals or combination of colours used by one undertaking on goods or services or other articles of commerce to distinguish it from other similar goods or services originating from a different undertaking.

INDUSTRIAL DESIGNS

A Design refers to the features of shape, configuration, pattern, ornamentation or composition of lines or colours applied to any article, whether in two or three dimensional (or both) forms. This may be applied by any industrial process or means (manual, mechanical or chemical) separately or by a combined process, which in the finished article appeals to and judged solely by the eye. An industrial design registration protects the ornamental or aesthetic aspect of an article. Designs may consist of three-dimensional features, such as the shape or surface of an article, or of two-dimensional features, such as patterns, lines or color.

INTEGRATED CIRCUITS, LAYOUT DESIGN

Integrated Circuit means a product having transistors and other circuitry elements, which are inseparably formed on a semiconductor material or an insulating material or inside the semiconductor material and designed to perform an electronic circuitry function.

The layout-design of a semiconductor integrated circuit means a layout of transistors and other circuitry elements and includes lead wires connecting such elements and expressed in any manner in semiconductor integrated circuits.

GEOGRAPHICAL INDICATIONS OF GOODS

Geographical Indications of Goods are defined as that aspect of industrial property which refers to the geographical indication referring to a country or to a place situated therein as being the country or place of origin of that product.

BIOLOGICAL DIVERSITY:

"Biological Diversity means the variability among living organisms from all sources and the ecological complexes of which they are part and includes diversity within species or between species and of eco-systems."

PLANT VARIETIES AND FARMERS RIGHTS

A plant variety represents a more precisely defined group of plants, selected from within a species, with a common set of characteristics. The Protection of Plant Varieties and Farmers' Right Act, 2001 has been enacted to provide for the establishment of an effective system for protection of plant varieties, the rights of farmers and plant breeders and to encourage the development of new varieties of plants. According to the Act, the term 'variety' means "a plant grouping except micro organism within a single botanical taxon of the lowest known rank.

UNDISCLOSED INFORMATION

Knowhow is another important form of intellectual property generated by R&D institutions that do not have the benefit of patent or copyright protection. Such know-how is kept undisclosed as trade secrets. A Trade Secret or undisclosed information is any information that has been intentionally treated as secret and is capable of commercial application with an economic interest. It protects information that confers a competitive advantage to those who possess such information, provided such information is not readily available with or discernible by the competitors.

HISTORY OF INTELLECTUAL PROPERTY RIGHTS IN INDIA

George Alfred DePenning is supposed to have made the first application for a patent in India in the year 1856. On February 28, 1856, the Government of India promulgated legislation or grant what was then termed as "exclusive privileges for the encouragement of inventions of new manufactures" i.e the Patents Act. On March 3, 1856, a civil engineer, George Alfred DePenning of 7, Grant's Lane, Calcutta petitioned the Government of India for grant of exclusive privileges for his invention - "An Efficient Punkah Pulling Machine". On September 2, DePenning, submitted the Specifications for his invention along with drawings to illustrate its morking. These were accepted and the invention was granted the first ever Intellectual Property protection in India.

- Categories of Intellectual Property
- IPRs can be classified into two categories:

- IPRs that stimulate inventive and creative activities (patents, utility models, industrial designs, copyright, plant breeders' rights and layout designs for integrated circuits) and
- IPRs that offer information to consumers (trademarks and geographical indications).

INTELLECTUAL PROPERTY TRENDS – INDIA

During 2009-10, 34,287 patent applications were filed, 6069 examined and 6168 patents granted. The number of applications filed by the Indian applicants was 7044. Out of the applications filed by the Indian applicants, Maharashtra accounted for the maximum number followed by Delhi, Tamil Nadu, Karnataka, Andhra Pradesh, West Bengal etc.

During 2009-10, 6092 design applications were filed, 6266 examined and 6025 registered. The number of applications filed by the Indian applicants was 4267. During 2009-10, 1,41,943 trademark applications were filed, 25875 examined and 67,490 registered. The total number of registered trademarks as of 31st March, 2010 is 8,22,825.

During 2009-10, 40 Geographical indications applications were filed and 14 were registered. A total of 120 Geographical Indications have been registered till 31st March, 2010. During 2009-10, 142 applications were received for access of bio-resources for research/commercial use, transfer of research results, intellectual property rights and third party transfer. Totally, 13 agreements have been signed. So far, 11 patents have been granted on the applications cleared by NBA.

In 2010-11, a total of 642 applications representing 28 crops were received by the Authority for seeking plant variety protection under the Act.

Initiatives of Government of India towards protection of IPR

The Government has brought out A Handbook of Copyright Law to create awareness of copyright laws amongst the stakeholders, enforcement agencies, professional users like the scientific and academic communities and the public. National Police Academy, Hyderabad and National Academy of Customs, Excise and Narcotics conducted several training programs on copyright laws for the police and customs officers.

The Department of Education, Ministry of Human Resource Development, Government of India has initiated several measures in the past for strengthening the enforcement of copyrights that include constitution of a Copyright Enforcement Advisory Council (CEAC), creation of separate cells in state police headquarters, encouraging setting up of collective administration societies and organization of seminars and workshops to create greater awareness of copyright laws among the enforcement personnel and the general public.

Special cells for copyright enforcement have so far been set up in 23 States and Union Territories, i.e. Andhra Pradesh, Assam, Andaman & Nicobar Islands, Chandigarh, Dadra & Nagar Haveli, Daman & Diu, Delhi, Goa, Gujarat, Haryana, Himachal Pradesh, Jammu & Kashmir, Karnataka, Kerala, Madhya Pradesh, Meghalaya, Orissa, Pondicherry, Punjab, Sikkim, Tamil Nadu, Tripura and West Bengal.

ISBN 978-81-933256-7-4

The Government also initiates a number of seminars/workshops on copyright issues. The articipants in these seminars include enforcement personnel as well as representatives of ndustry organizations.

OVERVIEW OF LAWS RELATED TO INTELLECTUAL PROPERTY RIGHTS IN INDIA

The Rules and Laws governing Intellectual Property Rights in India are as follows:

The Copyright Act, 1957, The Copyright Rules, 1958 and International Copyright Order, 1999

The Patents Act, 1970 The Patents Rules, 2003, The Intellectual Property Appellate Board (Patents Procedure) Rules, 2010 and The Patents (Appeals and Applications to the Intellectual Property Appellate Board) Rules, 2011. The Trade Marks Act, 1999, The Trade Marks Rules, 2002, The Trade Marks (Applications and Appeals to the Intellectual Property Appellate Board) Rules, 2003 and The Intellectual Property Appellate Board (Procedure) Rules, 2003. The Geographical Indications of Goods (Registration and Protection) Act, 1999 and The Geographical Indications of Goods (Registration and Protection) Rules, 2002. The Designs Act, 2000 and The Designs Rules, 2001. The Semiconductors Integrated Circuits Layout-Design Act, 2000 and The Semiconductors Integrated Circuits Layout-Design Rules, 2001. The Protection of Plant varieties and Farmers' Rights Act, 2001 and The Protection of Plant varieties and Farmers Rights' Rules, 2003. The Biological Diversity Act, 2002 and The Biological Diversity Rules, 2004. Intellectual Property Rights (Imported Goods) Rules, 2007, The Copyright (Amendment) Bill, 2012, Commercialization of Intellectual Property Rights by Licensing, Intellectual property may be commercialized by sale or assignment, or by entering into various types of contractual business relationships such as licensing.

The business vehicle by which this is done may be by way of partnership, joint venture or spinoff company. IPRs play a crucial role as the legal vehicle through which either the transfer of knowledge or the contractual relationship is effected. Alternatively, knowledge may be exploited in-house, in which case the role of IPRs is to block imitating competition. Commercialization can be defined as the process of turning an invention or creation into a commercially viable product, service or process. Commercialization may require additional R&D, product developments, clinical trials or development of techniques to scale-up production prior to taking the results of research to market. This is important because not all inventors or creators wish or have the resources, skills and appetite for risk to commercialize their own inventions or creations.

Public research organizations (PROs) usually fall into this category

Conclusion:

The importance of IPR and their protection is acknowledged the world over as essential to business. In tune with the world scenario, India too has recognized the value of IP, which recognition has been consistently upheld by legislators, courts and the industry. India is now a signatory to various IP treaties and conventions. This has helped India become more attuned to the world's approaches and attitudes towards IP protection. The enforcement of IPRs in India was not particularly effective. However, recent judicial rulings and steps taken by various enforcement agencies demonstrate that India is gearing up for effective protection and enforcement of IPRs. The Indian police has established special IP cells where specially trained police officers have been appointed to monitor IP infringement and cyber crimes. India has taken many positive steps toward improving its IPR regime and is expected to do much more in the coming years to streamline itself with the best practices in the field of intellectual property rights.

Dr. KRISHNA CHAPPIDI, M.Sc. Tech., N.E.T., P.G.D.C.A., Ph.D., Principal Pithapur Rajah's Government College (A) KAKINADA - 533 001.

Dr. Krishna, played import rules from 1991 as Senior Lecturer, Reader in the department of Geology. He published more than 50 articles in national and international journals and conferences. He received Best Teacher Award from Department of Higher Education, Government of Andhra Pradesh, State Awards to Meritorious Teachers 2003, "Marlyn & John Zeigler

Prize" for applied Geology, Andhra University, Visakhapatnam, "Best Habitation Award" during Janmabhoomi and Micro planning. He has two books under his credit, as course writer for "Environmental Geology, published by Telugu Academy, Hyderabad and Practical manual writer "Structual Geology and Paleontology" published by Dr. B.R.Ambedkar Open University, Hyderabad. He is expert in teaching and learning process by having extra and co-curricular activities like NSS Programme Officer, Janmabhoomi District Resource Person, Dr. B.R. Ambedkar Open University, Directorate of Distance Education - Coordinator, Sumabala Reddy Computer Centre Incharge, UGC Coordinator, NAC Coordinator, IQAC Coordinator, DCEDRC - Member Secretary, Academic Coordinator, Autonomous Coordinator, Life Member Indian Society for Technical Education. Government appointed him as Executive Council Member, Adikavi Nannayya University, Rajamahendravaram, (HIGHER EDUCATION (UE) DEPARTMENT) G.O.MS.No. 14, Dated: 22-02-2016.

Dr. J. PANDU RANGA RAO, M.Com, MBA, M.Phil, Ph.D., NET, APSET Asst. Professor, Dept. of Commerce Pithapur Rajah's Government College (A) KAKINADA - 533 001.

Dr. J. Pandu Ranga Rao has received his Bachelor Degree (B.Com.) from SKVT College, Rajamahendravaram, M.Com From Government Arts College, Rajamahendravaram both were affiliated to Andhra University, Visakhapatnam and M.Phil, Ph.D. from SGB Amaravathi University, Maharastra and has cleared UGC - NET and APSET.

He has been working as a Asst. Professor in the Department of Commerce, P.R. Govt. College, Kakinada. He has to his credit 18 years of teaching experience at Post Graduate and Under Graduate Levels. He has been teaching M.Com and B.Com Programmes. He is acting evaluator of Ph.D thesis for SGB Amaravathi University & other Universities and so far guided two M.Phil scholars. He has guideship at Adikavi Nannayya University, Rajamahendravaram. He acted as a Technical Chairperson in several seminars / conferences and published so far four books. He has to his credit more than 48 papers published in various National & International Journals . He has professional membership in India Society for Technical Education (MISTE) LMICA, IAA. He has expertise in the fields of Commerce and Management and got many laurels for his contribution in the field of Commerce and Management. He is acting as Managing Editor for "Common'man' Journal (www.ijocam.in) and 'spark' journal (www.irtsspark.com) & Associate Editor for International Journal of Advances in Arts, Science and Engineering (www.ijoaase.com)

Cancer is a group of diseases characterized by the uncontrolled growth and spreadof abnormal cells. If the spread is not controlled, it can result in death. Cancer is causedby external factors, such as tobacco, infectious organisms, and an unhealthy diet, andinternal factors, such as inherited genetic mutations, hormones, and immune conditions.These factors may act together or in sequence to cause cancer. Ten or more years oftenpass between exposure to external factors and detectable cancer.Worldwide, one in seven deaths is due to cancer; cancer causes more deaths thanAIDS, tuberculosis, and malaria combined. When countries are grouped according toincome, cancer is the second leading cause of death in high-income countries withcardiovascular diseases and the third leading cause of death in low and middle-incomecountries with cardiovascular diseases and infectious and parasitic diseases. According toestimates from the International Agency for Research on Cancer (IARC), there were 14.1million new cancer cases in 2012 worldwide, of which 8 million occurred in economicallydeveloping countries, which contain about 82% of the world's population. population.

Dr. Sapavat Madhavi completed her M.Sc Chemistry from Koti Womens college, Osmania University, Hyderabad. She awarded Ph.D Chemistry from Acharya Nagarjuna University, Nagarjuna Nagar, Andhra Pradesh, India. She working as Lecturer at Department of Chemistry, S.R.R. & C.V.R.

Govt. Degree College, Vijayawada, Andhra Pradesh, India.
